LED Driver for LCD Backlights

White LED Driver for 4Ch Large LCD Panels (DC/DC converter type)

BD9415FS

1.1 General Description
BD9415FS is a high efficiency driver for white LEDs and designed for large LCDs. This IC has a built-in boost DC/DC converter that employs an array of LEDs as the light source. BD9415FS has various protection functions against fault conditions, such as over-voltage protection (OVP), over current limit protection of DC/DC (OCP), short circuit protection (SCP), over duty protection (ODP) and open detection of LED string. Therefore, BD9415FS is available for the fail-safe design over a wide range of output voltages.

Features
- 4Ch LED constant current driver (external FET)
- Built-in boost DC/DC converter (external FET)
- PWM dimming (individual input terminal of 4ch)
- Analog dimming (Linear) function
- Low heat generation technology
- LED protection function (Open/Short protection)
- Output Short Protection (OCP)
- Over Duty Protection (ODP)
- Over Voltage Protection (OVP)
- Under Voltage Lockout Protection (UVLO)
- Auto restart function

Applications
- TV, Computer Display, Notebook, LCD Backlighting.

Key Specifications
- Operating power supply voltage: 11.5V to 35.0V
- Oscillator frequency: 500kHz (RT=30kΩ)
- Operating current: 6.2mA (Typ)
- Operating temperature range: -40°C to +105°C

1.2 Package
SSOP-A32
W(Typ) x D(Typ) x H(Max)
13.60mm x 7.80mm x 2.01mm
Pin pitch 0.80mm

Applications
TV, Computer Display, Notebook, LCD Backlighting.

  - VCC = 24V
  - Ta = 25°C
2.1 Pin Descriptions

- **PIN1 : VCC**
  This is the power supply pin of the IC. Input range is from 11.5V to 35V. The operation starts at more than 7.5V(Typ) and shuts down at less than 7.2V(Typ).

- **PIN2 : FAILB**
  This is FAILB signal output (OPEN DRAIN) pin. At normal operation, NMOS will be in OPEN state, during abnormality detection NMOS will be in ON (500 ohm(Typ)) state.

- **PIN3 : UVLO**
  Under Voltage Lockout pin is the input voltage of the power stage. IC starts boost operation if UVLO is more than 2.5V(Typ) and stops if lower than 2.4V(Typ). It can also be used for reset when latched off by protection. The power of step-up DC/DC converter needs to be set detection level by dividing the resistance.

- **PIN4 : REG90**
  The REG pin is used in the DC/DC converter driver block to output 9V. Available current is 20mA(Min). Using the REG pin at current higher than 20mA can affect the IC base voltage, causing the IC to malfunction and leading to heat generation of the IC itself. To avoid this problem, it is recommended to make load setting to the minimum level. The characteristic of VCC line regulation at REG90 is shown as [Figure 6]. VCC must be used in more than 11.5V for stable 9V output. Place the ceramic capacitor connected to REG90 pin (2.2uF to 10uF) closest to REG90-AGND pin.

- **PIN5 : STB**
  This is the ON/OFF setting terminal of the IC. It is allowed for use to reset the IC from shutdown. ※The IC state is switched according to voltages input in the STB pin. ※Avoid using the STB pin between two states (0.8 to 2.0V).

- **PIN6 : N**
  The N pin is used to output power to the external NMOS gate driver for the DC/DC converter in the amplitude range of approximately 0V to 9V. Output ON resistance H-side is 2.5Ω (Typ) and L-side is 3.0Ω (Typ). Frequency can be set by the resistor connected to RT. Refer to <RT> pin description for the frequency setting.

- **PIN7 : PGND**
  The PGND pin is a power ground pin for the driver block of the N output pin.

- **PIN8 : CS**
  CS pin is current detector for DC/DC current mode inductor current control pin. Current flowing through the inductor is converted into voltage by the current sensing resistor RCS connected to the CS pin and this voltage is compared with voltage set with the error amplifier to control the DC/DC output voltage. The CS pin also incorporates the over current protection (OCP) function. If the CS voltage reaches 0.45V(Typ) or more, switching operation will be forced to stopped.

- **PIN9 : DUTYON**
  This is the ON/OFF setting terminal of the LED PWM Over Duty Protection (ODP). By adjusting DUTYON input voltage, it is ON/OFF of the ODP adjusted.

<table>
<thead>
<tr>
<th>State</th>
<th>DUTYON input voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODP=ON</td>
<td>DUTYON= -0.3V to +0.8V</td>
</tr>
<tr>
<td>ODP=OFF</td>
<td>DUTYON= +1.5V to +18.0V</td>
</tr>
</tbody>
</table>

- **PIN10 : OVP**
  The OVP pin is an input pin for over voltage protection and short circuit protection of DC/DC output voltage. When voltage of it exceeds 3.0V(Typ), N pin will stop. This case is not CP count. When OVP pin voltage <0.2V(Typ) or lower, short circuit protection (SCP) function is activated, and output of gate driver will become low immediately. And system is stopped after a CP count. The setting example is separately described in the section "3.2.6 OVP Setting".
LED constant current driver is connected to the source of bill FET outside. Output current ILED is inversely proportional to the resistance value. This is the input pin for analog dimming signal. Output current ILED is directly proportional to the input voltage value. VREF pin is high impedance because the internal resistance is not connected to a certain bias. Even if VREF function is not used, pin bias is still required because the open connection of this pin is not a fixed potential.

VREF pin voltage is set as \( V_{\text{VREF}} \). LED current \( I_{\text{ILED}} \) can be calculated as below.

\[
I_{\text{LED}} [A] = \frac{V_{\text{VREF}} [V]}{R_S [\Omega]} \times 0.2
\]

For the adjustment of LED current with analog dimming by VREF, note that the output voltage of the DC/DC converter largely changes accompanied by LED VF changes if the VREF voltage is changed rapidly. In particularly, when the VREF voltages changed from high to low, it makes the LED terminal voltage seem higher transiently, which may influence application such as activation of the LED short circuit protection. It needs to be adequately verified with an actual device when analog dimming is used.

- **PIN11, 14, 17, 20 : S1-S4, PIN23 : VREF**
  - LED constant current driver is connected to the source of bill FET outside. Output current ILED is inversely proportional to the resistance value. This is the input pin for analog dimming signal. Output current ILED is directly proportional to the input voltage value. VREF pin is high impedance because the internal resistance is not connected to a certain bias. Even if VREF function is not used, pin bias is still required because the open connection of this pin is not a fixed potential.

- **PIN12, 15, 18, 21 : LED1-LED4**
  - LED constant current driver output pins. Drain of external NMOS is connected. Setting of LED current value is adjustable by setting the VREF voltage and connecting a resistor to S pin. For details, see the explanation of <PIN:11, 14, 17, 20 S1 - S4, Pin23 : VREF >.
  - The abnormal voltage of this pin activates the protection function of LED OPEN detection, LED SHORT detection. Please refer to <2.2 List of The Protection Function Detection Condition> for details.

- **PIN13, 16, 19, 22 : G1-G4**
  - This is the output terminal for driving the gate of the boost MOSFET. The high level is REG90. Frequency can be set by the resistor connected to RT. Refer to <RT> pin description for the frequency setting.

- **PIN24 : LSP**
  - LED Short detection voltage setting pin. Resistance voltage divider is internally on IC. It is set as 1.2V. When need to establish the other voltage, use an external resistance voltage divider.
  - LSP pin voltage is set as LED SHORT PROTECTION detection voltage and can be calculated as below.

\[
LED_{\text{SHORT}} = 6.7 \times V_{\text{LSP}} [V]
\]

\( LED_{\text{SHORT}} \) : LSP detection voltage, \( V_{\text{LSP}} \) : LSP pin voltage

Set LSP voltage in the range of 0.8V to 3.0V. In addition to considering the voltage of the internal resistance voltage divider, it's necessary to establish the voltage of the LSP terminal.

- **PIN25, 26, 27, 28 : PWM1-PWM4**
  - These are the PWM dimming signal input terminals. The high / low level of PWM pins are the following.

○PIN29 : DUTYP
This is the ODP setting pin. The ODP (Over Duty Protection) is the function to limit DUTY of LED PWM frequency fPWM by ODP detection Duty (ODPduty) set by resistance (RDUTY) connected to DUTYP pin.
○Relationship between LED PWM frequency fPWM, ODP Detection Duty and DUTYP resistance (ideal)

\[
R_{DUTYP} = \frac{1172 \times ODP_{duty}[^%]}{f_{PWM}[^Hz]} \quad [k\Omega]
\]

The RDUTYP setting ranges from 15kΩ to 600kΩ.
The setting example is separately described in section “3.2.6 ODP Setting”.

○PIN30 : RT
This is the DC/DC switching frequency setting pin. DCDC frequency is decided by connected resistor.
○The relationship between the frequency and RT resistance value (ideal)

\[
R_{RT} = \frac{15000}{f_{SW}[^kHz]} \quad [k\Omega]
\]

○PIN31 : SSFB
The SSFB pin is used to make setting of soft start time and duty for soft start, and DC/DC current mode control error amplifier. It performs constant current charge of 10uA to the external capacitor connected to SSFB terminal, which enables soft-start of DC/DC converter.
The SSFB pin detects the voltages of LED pins (1 to 4) and controls inductor current connected to SSFB terminal, which enables soft-start of DC/DC converter.
After completion of soft start, the SSFB pin is put into high-impedance state with the PWM signal being in the low state, thus maintaining the SSFB voltage.
Since the LED protection function (OPEN/SHORT detection) works when it turns to the LED feedback mode.

○PIN32 : AGND
This is the GND pin of the IC.

Figure 10. Basic Application Example

3.1.2 Application Example of Unused CH

![Application Example of Unused CH Diagram](image)

Figure 11. Application Example of Unused CH

When an LED terminal was unused, please dispose the unused CH as follows.
- Please input lower than 3.0V (typical) of voltage to a LEDx pin (ex. 1.0 to 2.0V).
- Gx pin, Sx pin is short
- Unused PWMx = L
3.2 External Components Selection

3.2.1 Startup operation and soft start (SSFB) capacitance setting

The following section describes the sequence for the startup of this IC.

Figure 12. Startup Waveform

Figure 13. Circuit Behavior at Startup

- **Description of startup sequence**
  1. Set the STB and PWM pin to “ON”.
  2. Set all systems to “ON”, SSFB charge will be initiated.
  3. Since the SSFB pin reach the lower limit of the internal sawtooth wave of the IC, the DC/DC converter operates to start VOUT voltage rising.
  4. The VOUT voltage continuously rising to reach a voltage at which LED current starts flowing.
  5. When the LED current reaches the set amount of current, the startup operation is completed.
  6. After that, conduct normal operation following the feedback operation sequence with the LED pins.

- **SSFB capacitance setting procedure**

  As aforementioned, this IC stops DC/DC converter when the PWM pin is set to Low level and conducts step-up operation only in the section in which the PWM pin is maintained at High level. Consequently, setting the PWM duty cycle to the minimum will extend the startup time. The startup time also varies with application settings of output capacitance, LED current, output voltage, and others.

  Startup time at minimum duty cycle can be approximated according to the following method:

  Make measurement of VOUT startup time with a 100% duty cycle, first. Take this value as “Trise100”.

  The startup time “Trise_min” for the relevant application with the minimum duty cycle is given by the following equation:

  \[
  T_{\text{rise}, \text{min}} = \frac{T_{\text{rise, 100}}}{\text{Min. Duty [ratio]}} \quad \text{[sec]}
  \]

  However, since this calculation method is just for approximation, use it only as a guide.

  Assuming that the SSFB pin voltage is VSSFB, the time is given by the following equation:

  \[
  T_{\text{SSFB}} = \frac{C_{\text{SSFB}}[F] \times V_{\text{SSFB}}[V]}{10[\mu A]} \quad \text{[Sec]}
  \]

  As a result, it is recommended to make SSFB capacitance setting so that “TSSFB” will be greater than “Trise_min”
3.2.2 LED Current Setting (VREF pin, Sx pin)

First, VREF voltage is determined. When performing Analog dimming, be careful of VREF pin input range(0.2 to 2.5V) and decide typical voltage.

In BD9415FS, LED constant current is controlled by Sx pin voltage as a reference point. Sx pin is controlled to become one fifth of the voltage of VREF pin voltage. In the case of VREF=1V, it is set to Sx=0.2V.

Therefore, when the resistance to Sx pin versus GND is set to "RS", the relationship between RS, VREF and ILED is as follows

\[ R_s[ohm] = \frac{V_{VREF}[V]}{I_{LED}[A]} \times 5 \]

3.2.3 LED Short Detection Voltage Setting (LSP terminal)

The voltage of LED short detection can be arbitrarily set up with LSP pin voltage. It is possible to change the LED short detection voltage, please input (0.8V to 3.0V) to LSP pin.

About LED short detection voltage, if "VLEDshort" and LSP pin voltage are set to "VLSPI", it is as follows

\[ V_{LSP} = \frac{V_{LED\_short}[V]}{6.7} \]

![Figure 14. LSP setting example](image)

Since the setting range of a LSP pin is set to 0.8V to 3.0V, VLEDshort can be set up in 5.36V to 20.1V.

- **Equation of setting LSP detect Voltage**

  When the detection voltage VLSPI of LSP is set up by resistance division of R1 and R2 using REG90, it becomes like the following formula.

  \[ LED\_short = \left( \frac{R2[k\Omega] \times R4[k\Omega] \times (R5\_90[V] \times R3 + 4[V] \times R1[k\Omega])}{(R1[k\Omega] \times R3[k\Omega] \times (R2 + R4) + R2[k\Omega] \times R4[k\Omega] \times (R1[k\Omega] + R3[k\Omega])} \right) \times 6.7 \ [V] \tag{2} \]

**[Setting example]**

Assuming that LSP is approximated by Equation (1) in order to set LSP detection voltage to 6V, R1 comes to 68kΩ and R2 comes to 7.6kΩ.

When calculating LSP detection voltage taking into account internal IC resistance by Equation (2), it will be given as:

\[ LED\_short = \left( \frac{7.6[k\Omega] \times 1200[k\Omega] \times (9[V] \times 2800[k\Omega] + 4[V] \times 68[k\Omega])}{(68[k\Omega] \times 2800[k\Omega] \times (7.6[k\Omega] + 1200[k\Omega]) + 7.6[k\Omega] \times 1200[k\Omega] \times (68[k\Omega] + 2800[k\Omega])} \right) \times 6.7 = 6.078[V] \tag{2} \]

*Also including the variation in IC, please also take the part variation in a set into consideration for an actual constant setup, and inquire enough to it.
3.2.4 DCDC Oscillation Frequency Setting
RRT which connects to RT pin sets the oscillation frequency \( f_{SW} \) of DCDC.

- Relationship between frequency \( f_{SW} \) and RT resistance (ideal)

\[
R_{RT} = \frac{15000}{f_{SW}[kHz]} [k\Omega]
\]

**[setting example]**
When DCDC frequency \( f_{SW} \) is set to 200kHz, \( R_{RT} \) is as follows.

\[
R_{RT} = \frac{15000}{200[kHz]} = 75[k\Omega]
\]

![Figure 15. RT terminal setting example](image)

3.2.5 UVLO Setting
Under Voltage Lockout pin is the input voltage of the power stage. IC starts boost operation if UVLO is more than 2.5V(Typ) and stops if lower than 2.4V(Typ). Since internal impedance exists in UVLO pin, cautions are needed for selection of resistance for resistance division.

Vin detection voltage level can be calculated by the following formula using resistance division of R1 and R2 (unit: kΩ).

- Equation of Setting UVLO Release

\[
Vin_{DET} = 2.5 \times \left\{ \frac{R1 + R2}{R2} + \left( \frac{1}{1400k + 125k} + \frac{1}{530k + 480k} \right) \times R1 \right\} [V]
\]

- Equation of Setting UVLO Lock

\[
Vin_{lock} = 2.4 \times \left\{ \frac{R1 + R2}{R2} + \left( \frac{1}{1400k + 125k} + \frac{1}{530k + 480k + 40k} \right) \times R1 \right\} [V]
\]

*Also including the variation in IC, please also take the part variation in a set into consideration for an actual constant setup, and inquire enough to it.*
3.2.6 OVP Setting

The OVP terminal is the input for over-voltage protection of output voltage. The OVP pin is high impedance, because the internal resistance is not connected to a certain bias.

Detection voltage of VOUT is set by dividing resistors R1 and R2. The resistor values can be calculated by the formula below.

○ OVP Detect Equation
If VOUT is boosted abnormally, VOVPDET, the detect voltage of OVP, R1, R2 can be expressed by the following formula.

\[ R1 = R2[k\Omega] \times \frac{(VOVP_{DET}[V] - 3.0[V])}{3.0[V]} \] [k\Omega]

○ OVP Release Equation
By using R1 and R2 in the above equation, the release voltage of OVP, VOVP can be expressed as follows.

\[ VOVP_{CAV} = 2.9[V] \times \frac{(R1[k\Omega] + R2[k\Omega])}{R2[k\Omega]} \]

**[setting example]**
If the normal output voltage, VOUT is 58V, the detect voltage of OVP is 63V, R2 is 20k\Ω, R1 is calculated as follows.

\[ R1 = R2[k\Omega] \times \frac{(VOVP_{DET}[V] - 3.0[V])}{3.0[V]} = 20[k\Omega] \times \frac{(63[V] - 3.0[V])}{3.0[V]} = 400[k\Omega] \]

By using these R1 and R2, the release voltage of OVP, VOVP can be calculated as follows.

\[ VOVP_{CAV} = 2.9[V] \times \frac{(R1[k\Omega] + R2[k\Omega])}{R2[k\Omega]} = 2.9[V] \times \frac{(400[k\Omega] + 20[k\Omega])}{20[k\Omega]} = 60.9[V] \]

3.2.7 SCP setting

[3.2.6] The SCP setting \( VSCP_{DET} \) voltage is calculated as below when R1,R2 is decided above:

\[ VSCP_{DET} = 0.2[V] \times \frac{(R1[k\Omega] + R2[k\Omega])}{R2[k\Omega]} = 0.2[V] \times \frac{(400[k\Omega] + 20[k\Omega])}{20[k\Omega]} = 40.2[V] \]

*Also including the variation in IC, please also take the part variation in a set into consideration for an actual constant setup, and inquire enough to it.

3.2.8 FAILB Logic

FAILB signal output pin (OPEN DRAIN); when an abnormality is detected, NMOS is brought into GND Level. The rating of this pin is 20V.

<table>
<thead>
<tr>

<td>OPEN</td>
</tr>
</tbody>
</table>

\( ^6 \)CP count : Count movement after detection of D-S SHORT, LED_OPEN, SHORT, SCP.
3.2.9 ODP setting

RDUTYP which connects to ODP pin sets the ODP detection duty.

\[ R_{DUTYP} = \frac{1172 \times ODPP_{duty} \, [\%]}{f_{PWM} \, [Hz]} \, [\Omega] \]

**Setting example**

When LED PWM frequency \( f_{PWM} \), is set to 120Hz and ODP Detection Duty (ODPduty) is set to 35\%, RDUTYP is as follows.

\[ R_{DUTYP} = \frac{1172 \times 35\%}{120\, [Hz]} = 341.8\, [\Omega] \]

![Figure 18. ODP setting example](image)

![Figure 19. The GATE and the DIMOUT waveform as PWM dimming (ODP)](image)

3.2.10 Timer Latch Time (CP Counter) Setting, Auto-Restart Timer Setting

Timer latch time (CP Counter) is set by counting the clock frequency which is set at the RT pin. About the behavior from abnormal detection to latch-off, please refer to the section "3.5.2 and 3.5.3 Timing Chart".

When various abnormal conditions happen, counting starts from the timing, latch occurs after below time has passed. Furthermore, even if PWM=L, if abnormal condition continues, timer count will not reset.

\[ LATCH_{TIME} = 2^{14} \times \frac{R_{RT} \, [\Omega]}{1.5 \times 10^{10}} = 16384 \times \frac{100 [\Omega]}{1.5 \times 10^{10}} = [s] \]

\[ AUTO_{TIME} = 2^{17} \times \frac{R_{RT} \, [\Omega]}{1.5 \times 10^{10}} = 131072 \times \frac{100 [\Omega]}{1.5 \times 10^{10}} [s] \]

Here, LATCHTIME = time until latch condition occurs, AUTOTIME = auto restart timer’s time

RRT = Resistor value connected to RT pin

**Setting example**

Timer latch time when RT=30kohm (500kHz)

\[ LATCH_{TIME} = 16384 \times \frac{30 \, [\Omega]}{1.5 \times 10^{10}} = 16384 \times \frac{30 [\Omega]}{1.5 \times 10^{10}} = 32.8\, [ms] \]

\[ AUTO_{TIME} = 131072 \times \frac{30 \, [\Omega]}{1.5 \times 10^{10}} = 131072 \times \frac{30 [\Omega]}{1.5 \times 10^{10}} = 262.1\, [ms] \]
3.3. DCDC Parts Selection

3.3.1. OCP Setting / Calculation Method for the Current Rating of DCDC Parts

OCP detection stops the switching when the CS pin voltage is more than 0.45V(Typ). The resistor value of CS pin, RCS needs to be considered by the coil L current. And the current rating of DCDC external parts is required more than the peak current of the coil.

Shown below are the calculation method of the coil peak current, the selection method of Rcs (the resistor value of CS pin) and the current rating of the external DCDC parts at Continuous Current Mode.

(The calculation method of the coil peak current, \(I_{\text{PEAK}}\) at Continuous Current Mode)

At first, since the ripple voltage at CS pin depends on the application condition of DCDC, the following variables are used.

\[
\text{Vout voltage } = V_{\text{OUT}} \ [\text{V}]
\]

\[
\text{LED total current } = I_{\text{OUT}} \ [\text{A}]
\]

\[
\text{DCDC input voltage of the power stage } = V_{\text{IN}} \ [\text{V}]
\]

Efficiency of DCDC = \(\eta\) [%]

And then, the average input current \(I_{\text{IN}}\) is calculated by the following equation.

\[
I_{\text{IN}} = \frac{V_{\text{OUT}}[\text{V}] \times I_{\text{OUT}}[\text{A}]}{V_{\text{IN}}[\text{V}] \times \eta[\%]} \quad \text{[A]}
\]

And the ripple current of the inductor \(L\) (\(\Delta I[L]\)) can be calculated by using DCDC the switching frequency, \(f_{\text{SW}}\), as follows.

\[
\Delta I[L] = \frac{(V_{\text{OUT}}[\text{V}] - V_{\text{IN}}[\text{V}]) \times V_{\text{IN}}[\text{V}]}{L[H] \times f_{\text{SW}}[\text{Hz}]} \quad \text{[A]}
\]

On the other hand, the peak current of the inductor \(I_{\text{PEAK}}\) can be expressed as follows.

\[
I_{\text{PEAK}} = I_{\text{IN}}[\text{A}] + \frac{\Delta I[L][\text{A}]}{2} \quad \text{... (1)}
\]

Therefore, the bottom of the ripple current \(I_{\text{MIN}}\) is

\[
I_{\text{MIN}} = I_{\text{IN}}[\text{A}] - \frac{\Delta I[L][\text{A}]}{2} \quad \text{or } 0
\]

If \(I_{\text{MIN}} > 0\), the operation mode is CCM (Continuous Current Mode), otherwise the mode is DCM (Discontinuous Current Mode).

(The selection method of \(R_{\text{CS}}\) at Continuous Current Mode)

\(I_{\text{PEAK}}\) flows into \(R_{\text{CS}}\) and that causes the voltage signal to CS pin. (Please refer to the timing chart at the right)

Peak voltage \(V_{\text{CS_Peak}}\) is as follows.

\[
V_{\text{CS_Peak}} = R_{\text{CS}} \times I_{\text{PEAK}}[\text{V}]
\]

As this \(V_{\text{CS_Peak}}\) reaches 0.4V (typical), the DCDC output stops the switching.

Therefore, \(R_{\text{CS}}\) value is necessary to meet the condition below.

\[
R_{\text{CS}} \times I_{\text{PEAK}}[\text{V}] <<< 0.45[V]
\]

(The current rating of the external DCDC parts)

The peak current as the CS voltage reaches OCP level (0.4V (Typ)) is defined as \(I_{\text{PEAK_DET}}\).

\[
I_{\text{PEAK_DET}} = \frac{0.45[V]}{R_{\text{CS}}[\Omega]} \quad \text{[A]} \quad \text{... (2)}
\]

The relationship among \(I_{\text{PEAK}}\) (equation (1)), \(I_{\text{PEAK_DET}}\) (equation (2)) and the current rating of parts is required to meet the following

\[
I_{\text{PEAK}} <<< I_{\text{PEAK_DET}} <<< \text{The current rating of parts}
\]

Please make the selection of the external parts such as FET, Inductor, diode meet the above condition.
**[setting example]**

Output voltage = $V_{OUT} [V] = 40V$

LED total current = $I_{OUT} [A] = 0.48A$

DCDC input voltage of the power stage = $V_{IN} [V] = 24V$

Efficiency of DCDC = $\eta [%] = 90\%$

Averaged input current $I_{IN}$ is calculated as follows.

$$I_{IN} = \frac{V_{OUT}[V] \times I_{OUT}[A]}{V_{IN}[V] \times \eta[\%]} = \frac{40[V] \times 0.48[A]}{24[V] \times 90[\%]} = 0.89[A]$$

If the switching frequency, $f_{SW} = 200kHz$, and the inductor, $L=100\mu H$, the ripple current of the inductor $L$ ($\Delta I_L[A]$) can be calculated as follows.

$$\Delta I_L = \left( \frac{V_{OUT}[V] - V_{IN}[V]}{L[H]} \times V_{IN}[V] \times f_{SW}[Hz] \right) = \left( \frac{40[V] - 24[V]}{100 \times 10^{-6}[H]} \times 40[V] \times 200 \times 10^3[Hz] \right) = 0.48[A]$$

Therefore the inductor peak current, $I_{PEAK}$ is

$$I_{PEAK} = I_{IN}[A] + \frac{\Delta I_L[A]}{2} = 0.89[A] + \frac{0.48[A]}{2} = 1.13[A]$$

\[\text{--- calculation result of the peak current}\]

If $R_{CS}$ is assumed to be $0.3\Omega$

$$V_{CS\_PEAK} = R_{CS} \times I_{PEAK} = 0.3[\Omega] \times 1.13[A] = 0.339[V] \ll 0.45[V]$$

\[\text{---} R_{CS} \text{ value confirmation}\]

The above condition is met.

And $I_{PEAK\_DET}$, the current OCP works, is

$$I_{PEAK\_DET} = \frac{0.48[V]}{0.3[\Omega]} = 1.33[A]$$

If the current rating of the used parts is $2A$, $I_{peak} \ll I_{PEAK\_DET} \ll 1.33[A] \ll 1.33[A] \ll 2.0[A]$ \[\text{--- current rating confirmation of DCDC}\]

This inequality meets the above relationship. The parts selection is proper. And $I_{MIN}$, the bottom of the IL ripple current, can be calculated as follows.

$$I_{MIN} = I_{IN}[A] - \frac{\Delta I_L[A]}{2} = 1.13[A] - 0.48[A] = 0.65[A] \gg 0$$

This inequality implies that the operation is continuous current mode.
3.3.2. Inductor Selection

The inductor value affects the input ripple current, as shown in the previous section 3.3.1.

\[
\Delta I_L = \frac{(V_{OUT}[V] - V_{IN}[V]) \times V_{IN}[V]}{L[\text{H}] \times V_{OUT}[V] \times f_{SW}[\text{Hz}]} \quad [A]
\]

\[
I_{IN} = \frac{V_{OUT}[V] \times I_{OUT}[A]}{V_{IN}[V] \times \eta\%} \quad [A]
\]

\[
I_{PEAK} = I_{IN}[A] + \frac{\Delta I_L[A]}{2} \quad [A]
\]

Where:
- \( L \): coil inductance [H]
- \( V_{OUT} \): DCDC output voltage [V]
- \( V_{IN} \): input voltage [V]
- \( I_{OUT} \): output load current (the summation of LED current) [A]
- \( I_{IN} \): input current [A]
- \( f_{SW} \): oscillation frequency [Hz]

![Inductor current waveform and diagram](figure)

In continuous current mode, \( \Delta I_L \) is set to 30% to 50% of the output load current in many cases.

In using smaller inductor, the boost is operated by the discontinuous current mode in which the coil current returns to zero at every period.

* The current exceeding the rated current value of inductor flown through the coil causes magnetic saturation, resulting in a decrease in efficiency. Inductor needs to be selected to have such adequate margin that peak current does not exceed the rated current value of the inductor.

* To reduce inductor loss and improve efficiency, an inductor with low resistance components (DCR, ACR) needs to be selected.

3.3.3. Output Capacitance \( C_{OUT} \) Selection

Output capacitor needs to be selected in consideration of equivalent series resistance required to even the stable area of output voltage or ripple voltage. Be aware that set LED current may not be flown due to decrease in LED terminal voltage if output ripple component is high.

Output ripple voltage \( V_{OUT} \) is determined by Equation (4):

\[
\Delta V_{OUT} = \Delta I_L \times R_{ESR}[V] \quad \cdots \quad (4)
\]

When the coil current is charged to the output capacitor as MOS turns off, much output ripple is caused. Much ripple voltage of the output capacitor may cause the LED current ripple.

![Output capacitor diagram](figure)

* Rating of capacitor needs to be selected to have adequate margin against output voltage.

* To use an electrolytic capacitor, adequate margin against allowable current is also necessary. Be aware that the LED current is larger than the set value transitionally in case that LED is provided with PWM dimming especially.

3.3.4. MOSFET Selection

There is no problem if the absolute maximum rating is larger than the rated current of the inductor \( L \), or is larger than the sum of the tolerance voltage of \( C_{OUT} \) and the rectifying diode \( VF \). The product with small gate capacitance (injected charge) needs to be selected to achieve high-speed switching.

* One with over current protection setting or higher is recommended.

* The selection of one with small on resistance results in high efficiency.

3.3.5. Rectifying Diode Selection

A schottky barrier diode which has current ability higher than the rated current of \( L \), reverse voltage larger than the tolerance voltage of \( C_{OUT} \), and low forward voltage \( VF \) especially needs to be selected.
3.4 Loop Compensation

A current mode DCDC converter has each one pole (phase lag) $f_P$ due to CR filter composed of the output capacitor and the output resistance (= LED current) and zero (phase lead) $f_Z$ by the output capacitor and the ESR of the capacitor. Moreover, a step-up DCDC converter has RHP zero (right-half plane zero point) $f_{ZRHP}$ which is unique with the boost converter. This zero may cause the unstable feedback. To avoid this by RHP zero, the loop compensation that the cross-over frequency $f_c$, set as follows, is suggested.

$$f_c = \frac{f_{ZRHP}}{5} \quad (f_{ZRHP}: \text{RHP zero frequency})$$

Considering the response speed, the calculated constant below is not always optimized completely. It needs to be adequately verified with an actual device.

Figure 23. Output stage and error amplifier diagram

i. Calculate the pole frequency $f_P$ and the RHP zero frequency $f_{ZRHP}$ of DC/DC converter

$$f_P = \frac{I_{LED}}{2\pi \times V_{OUT} \times C_{OUT}} \quad [\text{Hz}]$$

$$f_{ZRHP} = \frac{V_{OUT} \times (1-D)^2}{2\pi \times L \times I_{LED}} \quad [\text{Hz}]$$

Where $I_{LED}$ = the summation of LED current, $D = \frac{V_{OUT} - V_{IN}}{V_{OUT}}$. (Continuous Current Mode)

ii. Calculate the phase compensation of the error amp output ($f_c = f_{ZRHP}/5$)

$$R_{FB1} = \frac{f_{ZRHP} \times R_{CS} \times I_{LED}}{5 \times f_P \times g_m \times V_{OUT} \times (1-D)} \quad [\Omega]$$

$$C_{FB1} = \frac{1}{2\pi \times R_{FB1} \times f_c} = \frac{5}{2\pi \times R_{FB1} \times f_{ZRHP}} \quad [\text{F}]$$

$$g_m = 4.0 \times 10^{-4} \quad [\text{S}]$$

Above equation is described for lighting LED without the oscillation. The value may cause much error if the quick response for the abrupt change of dimming signal is required.

To improve the transient response, $R_{FB1}$ needs to be increased, and $C_{FB1}$ needs to be decreased. It needs to be adequately verified with an actual device in consideration of variation from parts to parts since phase margin is decreased.
3.5. Timing Chart

3.5.1 PWM Start Up

Figure 24. Start Up

(*1)…REG90 starts up when STB is changed from Low to High. In the state where the PWM signal is not inputted, SS terminal is not charged and DCDC doesn't start to boost, either.

(*2)…When REG90 is more than 5.8V(Typ), the reset signal is released.

(*3)…The charge of the pin SS starts at the positive edge of PWM=L to H, and the soft start starts. The pin SS continues charging in spite of the assertion of PWM or OVP level.

(*4)…The soft start interval will end if the LED_OK = H (internal signal), By this time, it boosts VOUT to the voltage where the set LED current flows. The abnormal detection of FBMAX starts to be monitored.

(*5)…As STB=L, the boost operation is stopped instantaneously. (N=L, SSFB=L)
3.5.2 LED OPEN Detection

Figure 25. LED OPEN Detection
3.5.3 LED SHORT Detection

Figure 26. LED SHORT Detection
3.5.4 Over Duty Protection

Figure 27. Over Duty Protection

ODP=35% setup

(*1) ...PWM < 35% : Turn on in relevant CH of same time PWM_DutyH.

(*2) ...PWM > 35% : An LED of relevant CH is turn off by PWM_DutyH=35%.

(*3) ...PWM=H signal beyond 35% is changed, and that doesn't react to IC in particular.

(*4) ...PWM > 35% : An LED of relevant CH is turn off by PWM_DutyH=35%.

(*5) ...ODP Function= ON : When a PWM signal is equivalent to 100%, LED=OFF continues after 35 %.

(*6) ... When the next PWM=H signal is input, an LED is also turn on at the same time.

Figure 28. Internal Equivalent Circuits
Operational Notes

1. Reverse Connection of Power Supply
   Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC’s power supply pins.

2. Power Supply Lines
   Design the PCB layout pattern to provide low impedance supply lines. Connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. Ground Voltage
   Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. Ground Wiring Pattern
   When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. Thermal Consideration
   Should by any chance the maximum junction temperature rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the maximum junction temperature rating.

6. Recommended Operating Conditions
   These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

7. Inrush Current
   When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

8. Operation Under Strong Electromagnetic Field
   Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

9. Testing on Application Boards
   When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC’s power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

10. Inter-pin Short and Mounting Errors
    Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

11. Unused Input Pins
    Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.
12. Regarding the Input Pin of the IC
This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.
When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

![Figure 29. Example of monolithic IC structure](image)

13. Ceramic Capacitor
When using a ceramic capacitor, determine the dielectric constant considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

14. Area of Safe Operation (ASO)
Operate the IC such that the output voltage, output current, and the maximum junction temperature rating are all within the Area of Safe Operation (ASO).

15. Thermal Shutdown Circuit (TSD)
This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC’s maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF all output pins. When the Tj falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

16. Over Current Protection Circuit (OCP)
This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

17. Disturbance light
In a device where a portion of silicon is exposed to light such as in a WL-CSP, IC characteristics may be affected due to photoelectric effect. For this reason, it is recommended to come up with countermeasures that will prevent the chip from being exposed to light.

Notice

Precaution on using ROHM Products

1. Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment (Note1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM’s Products for Specific Applications.

(Note1) If you use our Products in devices requiring extremely high reliability, please consult with the ROHM sales representative in advance.

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
   [a] Installation of protection circuits or other protective devices to improve system safety
   [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM’s Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc., prior to use, must be necessary:
   [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
   [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
   [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
   [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
   [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
   [f] Sealing or coating our Products with resin or other coating materials
   [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
   [h] Use of the Products in places subject to dew condensation

4. The Products are not subject to radiation-proof design.

5. Please verify and confirm characteristics of the final or mounted products in using the Products.

6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse, is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8. Confirm that operation temperature is within the specified range described in the product specification.

9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification
Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic
This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation
1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
   [a] the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
   [b] the temperature or humidity exceeds those recommended by ROHM
   [c] the Products are exposed to direct sunshine or condensation
   [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label
A two-dimensional barcode printed on ROHM Products label is for ROHM’s internal use only.

Precaution for Disposition
When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act
Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights
1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution
1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.
General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.

2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.

3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
