
16-Bit Microcontrollers and Digital Signal Controllers with High-Speed PWM, Op Amps and Advanced Analog

Operating Conditions

- 3.0V to 3.6V, -40°C to +85°C, DC to 70 MIPS
- 3.0V to 3.6V, -40°C to +125°C, DC to 60 MIPS
- 3.0V to 3.6V, -40°C to +150°C, DC to 40 MIPS

Core: 16-Bit dsPIC33E/PIC24E CPU

- Code Efficient (C and Assembly) Architecture
- Two 40-Bit Wide Accumulators
- Single Cycle (MAC/MPY) with Dual Data Fetch
- Single-Cycle, Mixed-Sign MUL plus Hardware Divide
- 32-Bit Multiply Support

Clock Management

- 1.0% Internal Oscillator
- Programmable PLLs and Oscillator Clock Sources
- Fail-Safe Clock Monitor (FSCM)
- Independent Watchdog Timer (WDT)
- Fast Wake-up and Start-up

Power Management

- Low-Power Management modes (Sleep, Idle, Doze)
- Integrated Power-on Reset and Brown-out Reset
- 0.6 mA/MHz Dynamic Current (typical)
- 30 μ A IPD Current (typical)

High-Speed PWM

- Up to Three PWM Pairs with Independent Timing
- Dead Time for Rising and Falling Edges
- 7.14 ns PWM Resolution
- PWM Support for:
 - DC/DC, AC/DC, Inverters, PFC, Lighting
 - BLDC, PMSM, ACIM, SRM
- Programmable Fault Inputs
- Flexible Trigger Configurations for ADC Conversions

Advanced Analog Features

- ADC module:
 - Configurable as 10-bit, 1.1 Msps with four S&H or 12-bit, 500 ksp/s with one S&H
 - Six analog inputs on 28-pin devices and up to 16 analog inputs on 64-pin devices
- Flexible and Independent ADC Trigger Sources
- Up to Three Op Amp/Comparators with Direct Connection to the ADC module:
 - Additional dedicated comparator
 - Programmable references with 32 voltage points
- Charge Time Measurement Unit (CTMU):
 - Supports mTouch[®] capacitive touch sensing
 - Provides high-resolution time measurement (1 ns)
 - On-chip temperature measurement

Timers/Output Compare/Input Capture

- 12 General Purpose Timers:
 - Five 16-bit and up to two 32-bit timers/counters
 - Four Output Compare (OC) modules, configurable as timers/counters
 - PTG module with two configurable timers/counters
 - 32-bit Quadrature Encoder Interface (QEI) module, configurable as a timer/counter
- Four Input Capture (IC) modules
- Peripheral Pin Select (PPS) to allow Function Remap
- Peripheral Trigger Generator (PTG) for Scheduling Complex Sequences

Communication Interfaces

- Two UART modules (17.5 Mbps):
 - With support for LIN/J2602 protocols and IrDA[®]
- Two Four-Wire SPI modules (15 Mbps)
- ECAN[™] module (1 Mbaud) CAN 2.0B Support
- Two I²C modules (up to 1 Mbaud) with SMBus Support
- PPS to allow Function Remap
- Programmable Cyclic Redundancy Check (CRC)

Direct Memory Access (DMA)

- 4-Channel DMA with User-Selectable Priority Arbitration
- UART, SPI, ADC, ECAN, IC, OC and Timers

Input/Output

- Sink/Source 12 mA or 6 mA, Pin-Specific for Standard V_{OH}/V_{OL}, Up to 22 or 14 mA, respectively for Non-Standard V_{OH1}
- 5V Tolerant Pins
- Peripheral Pin Select (PPS) to allow Digital Function Remapping
- Selectable Open-Drain, Pull-ups and Pull-Downs
- Up to 5 mA Overvoltage Clamp Current
- Change Notification Interrupts on All I/O Pins

Qualification and Class B Support

- AEC-Q100 REVG (Grade 1, -40°C to +125°C)
- AEC-Q100 REVG (Grade 0, -40°C to +150°C)
- Class B Safety Library, IEC 60730

Debugger Development Support

- In-Circuit and In-Application Programming
- Two Program and Two Complex Data Breakpoints
- IEEE 1149.2 Compatible (JTAG) Boundary Scan
- Trace and Run-Time Watch

TABLE 2: dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X MOTOR CONTROL FAMILIES

| Device | Page Erase Size (Instructions) | Program Flash Memory (Kbytes) | RAM (Kbytes) | Remappable Peripherals | | | | | | | | I ² C | CRC Generator | 10-Bit/12-Bit ADC (Channels) | Op Amps/Comparators | CTMU | PTG | I/O Pins | Pins | Packages | |
|-------------------|--------------------------------|-------------------------------|--------------|------------------------|---------------|----------------|--|------------------------------|------|-------------------|------------------|------------------|---------------|------------------------------|---------------------|--------------------|-----|----------|------|----------|--|
| | | | | 16-Bit/32-Bit Timers | Input Capture | Output Compare | Motor Control PWM ⁽⁴⁾ (Channels) | Quadrature Encoder Interface | UART | SP ⁽²⁾ | ECAN™ Technology | | | | | | | | | | External Interrupts ⁽³⁾ |

| dsPIC33EP128MC206 | 1024 | 128 | 16 | | | | | | | | | | | | | | | | | | |
| dsPIC33EP256MC206 | 1024 | 256 | 32 | | | | | | | | | | | | | | | | | | |
| dsPIC33EP512MC206 | 1024 | 512 | 48 | | | | | | | | | | | | | | | | | | |
| dsPIC33EP32MC502 | 512 | 32 | 4 | 5 | 4 | 4 | 6 | 1 | 2 | 2 | 1 | 3 | 2 | 1 | 6 | 2/3 ⁽¹⁾ | Yes | Yes | 21 | 28 | SPDIP, SOIC, SSOP ⁽⁵⁾ , QFN-S |
| dsPIC33EP64MC502 | 1024 | 64 | 8 | | | | | | | | | | | | | | | | | | |
| dsPIC33EP128MC502 | 1024 | 128 | 16 | | | | | | | | | | | | | | | | | | |
| dsPIC33EP256MC502 | 1024 | 256 | 32 | | | | | | | | | | | | | | | | | | |
| dsPIC33EP512MC502 | 1024 | 512 | 48 | 5 | 4 | 4 | 6 | 1 | 2 | 2 | 1 | 3 | 2 | 1 | 8 | 2/4 | Yes | Yes | 25 | 36 | VTLA, UQFN |
| dsPIC33EP32MC503 | 512 | 32 | 4 | | | | | | | | | | | | | | | | | | |
| dsPIC33EP64MC503 | 1024 | 64 | 8 | | | | | | | | | | | | | | | | | | |

- Note 1:** On 28-pin devices, Comparator 4 does not have external connections. Refer to [Section 25.0 “Op Amp/Comparator Module”](#) for details.
2: Only SPI2 is remappable.
3: INT0 is not remappable.
4: Only the PWM Faults are remappable.
5: The SSOP and VTLA packages are not available for devices with 512 Kbytes of memory.

TABLE 2: dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X MOTOR CONTROL FAMILIES (CONTINUED)

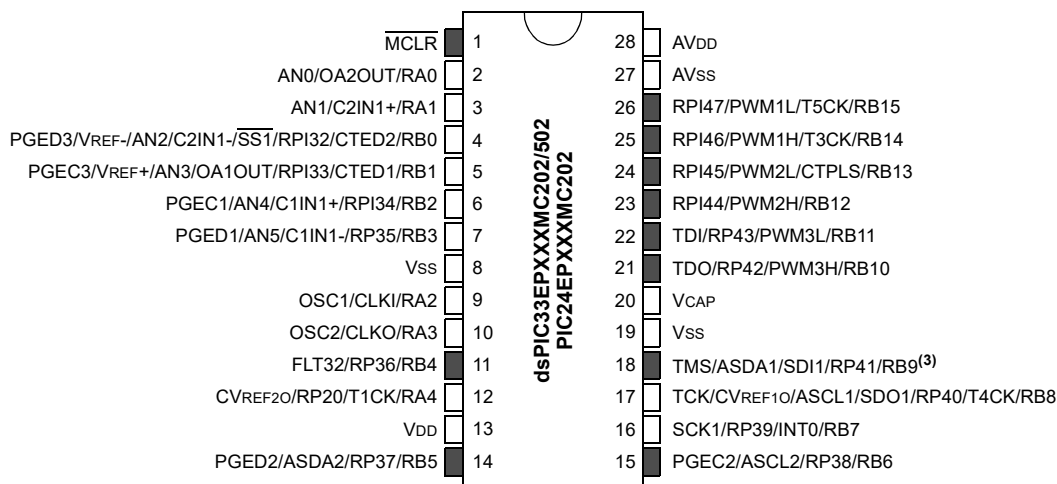

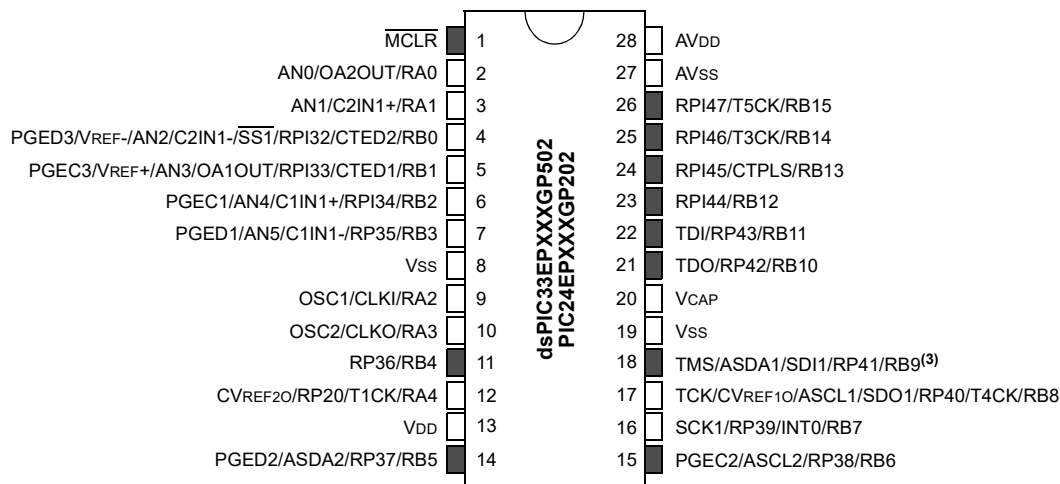

| Device | Page Erase Size (Instructions) | Program Flash Memory (Kbytes) | RAM (Kbytes) | Remappable Peripherals | | | | | | | | I ² C | CRC Generator | 10-Bit/12-Bit ADC (Channels) | Op Amps/Comparators | CTMU | PTG | I/O Pins | Pins | Packages | |
|-------------------|--------------------------------|-------------------------------|--------------|------------------------|---------------|----------------|--|------------------------------|------|--------------------|------------------|------------------|---------------|------------------------------|---------------------|------|-----|----------|------|-----------|--|
| | | | | 16-Bit/32-Bit Timers | Input Capture | Output Compare | Motor Control PWM ⁽⁴⁾ (Channels) | Quadrature Encoder Interface | UART | SPI ⁽²⁾ | ECAN™ Technology | | | | | | | | | | External Interrupts ⁽³⁾ |
| dsPIC33EP32MC504 | 512 | 32 | 4 | 5 | 4 | 4 | 6 | 1 | 2 | 2 | 1 | 3 | 2 | 1 | 9 | 3/4 | Yes | Yes | 35 | 44/ 48 | VTLA ⁽⁵⁾ TQFP, QFN, UQFN |
| dsPIC33EP64MC504 | 1024 | 64 | 8 | | | | | | | | | | | | | | | | | | |

| dsPIC33EP512MC506 | 1024 | 512 | 48 | | | | | | | | | | | | | | | | | | |

- Note 1:** On 28-pin devices, Comparator 4 does not have external connections. Refer to [Section 25.0 “Op Amp/Comparator Module”](#) for details.
2: Only SPI2 is remappable.
3: INT0 is not remappable.
4: Only the PWM Faults are remappable.
5: The SSOP and VTLA packages are not available for devices with 512 Kbytes of memory.

Pin Diagrams

28-Pin SPDIP/SOIC/SSOP^(1,2)

■ = Pins are up to 5V tolerant

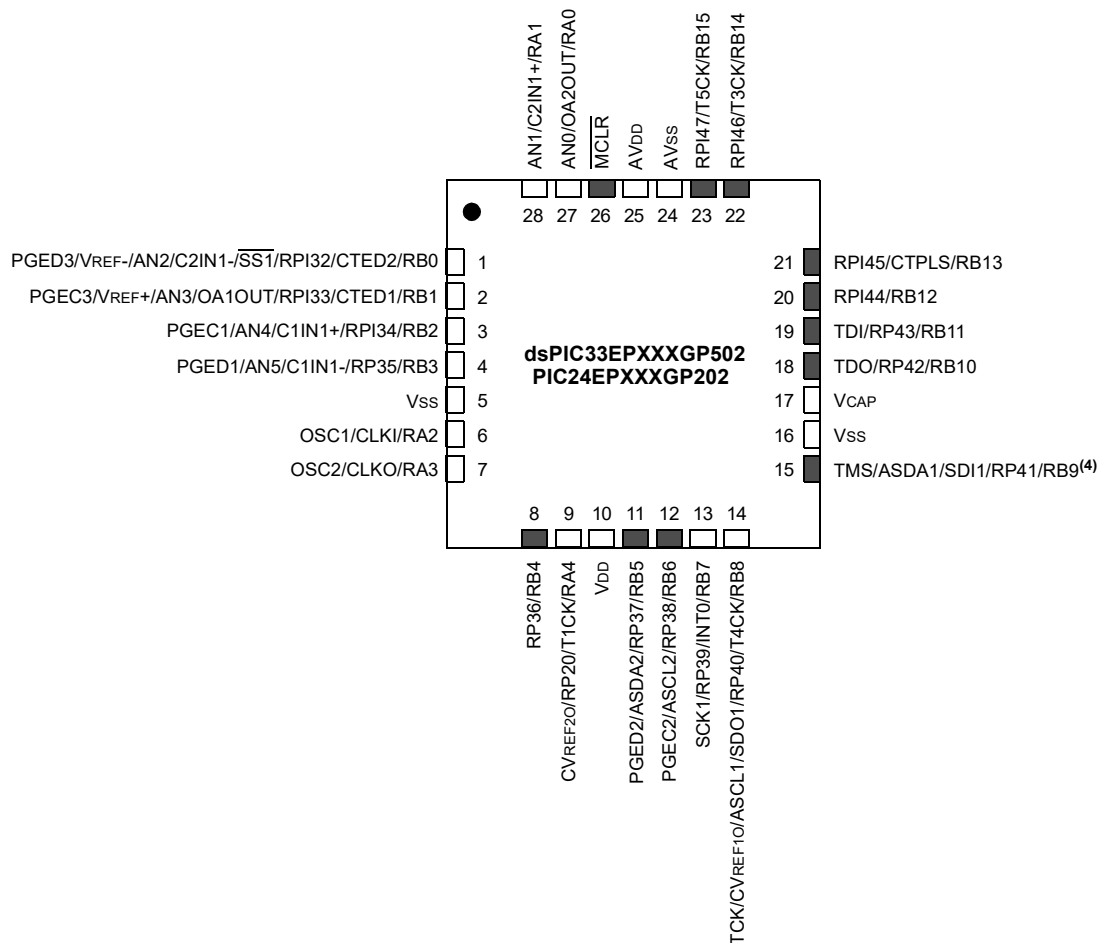

- Note 1:** The RPN/RPIn pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGx) can be used as a Change Notification pin (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

28-Pin QFN-S^(1,2,3)

■ = Pins are up to 5V tolerant

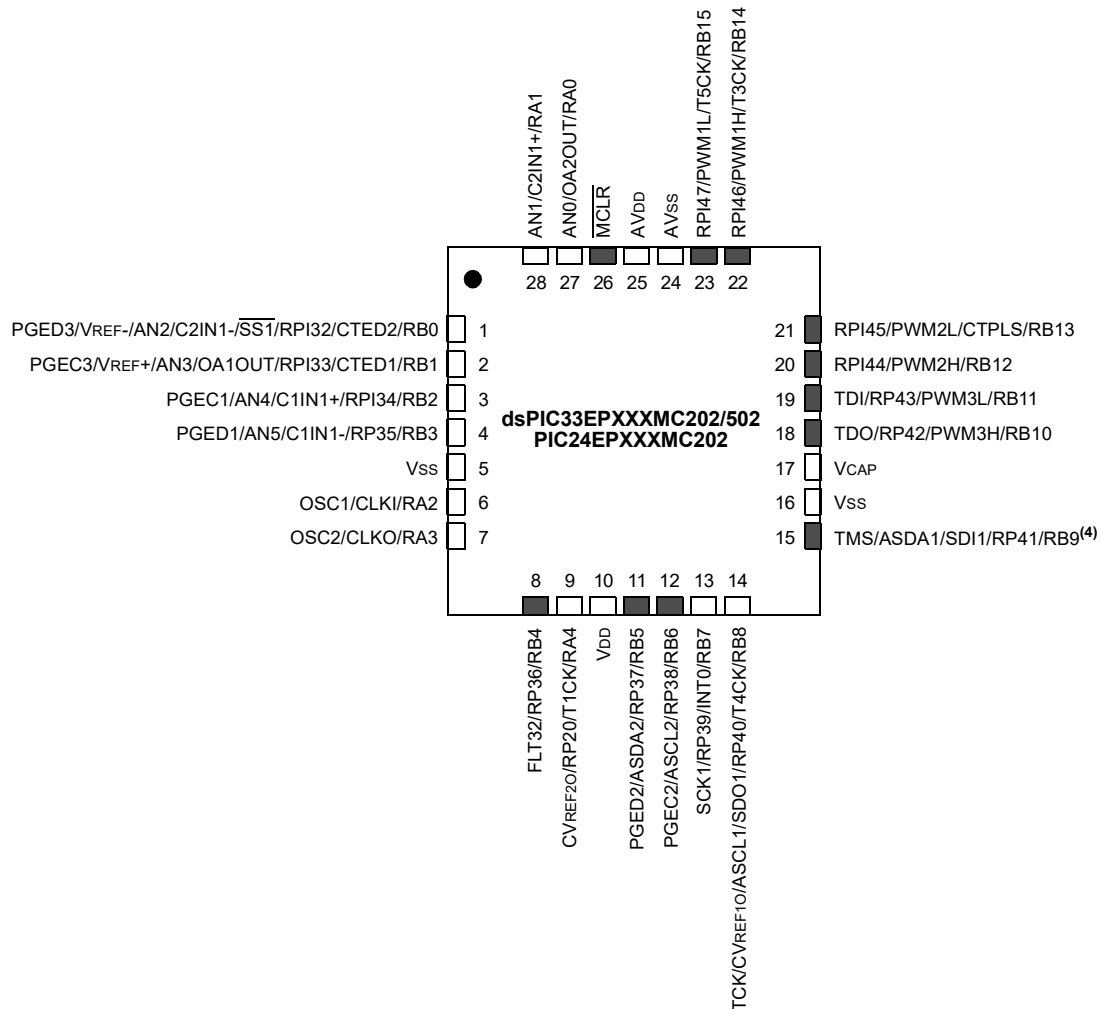

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to Vss externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

28-Pin QFN-S^(1,2,3)

■ = Pins are up to 5V tolerant

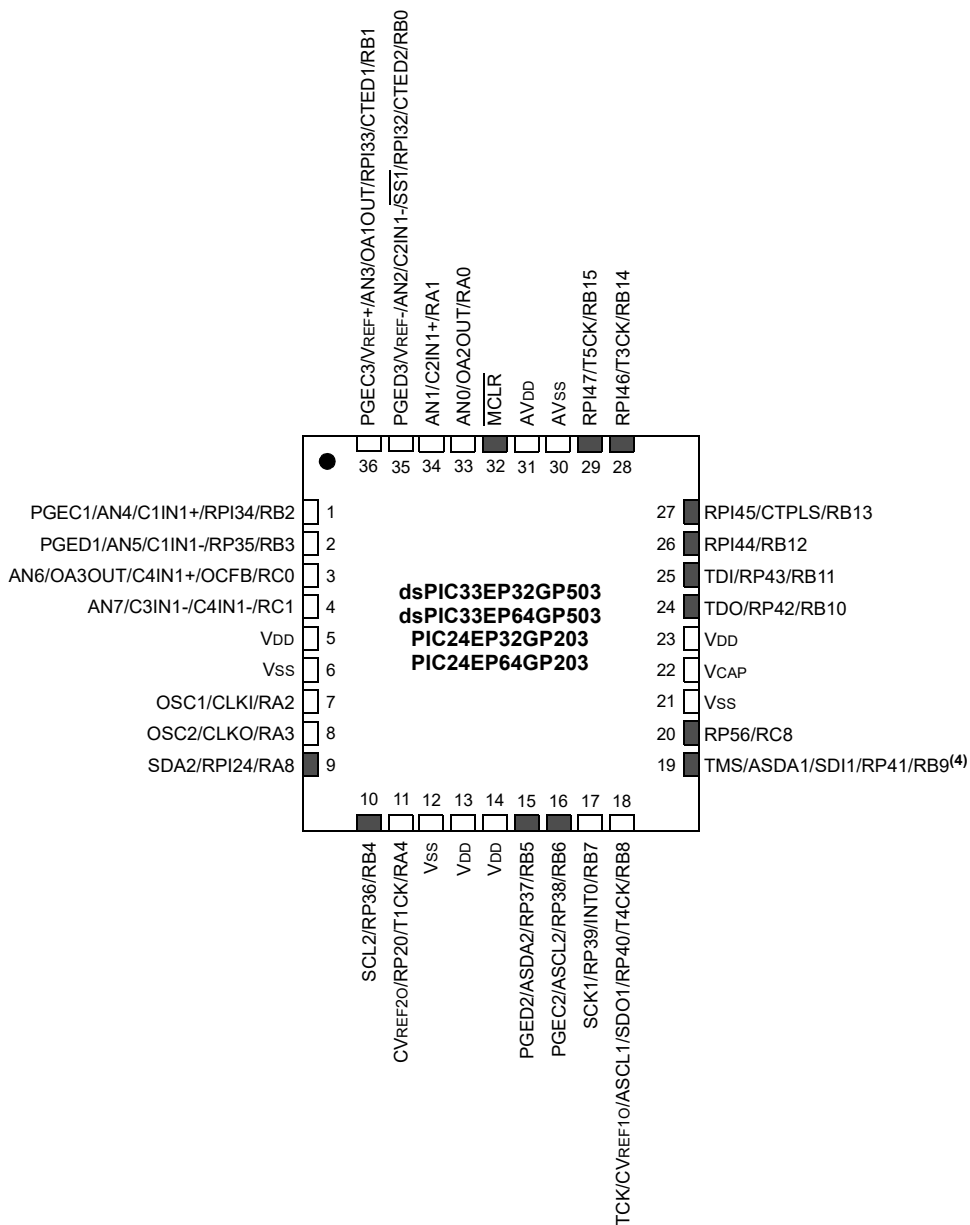

- Note 1:** The RPN/RPIn pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- 2:** Every I/O port pin (RAX-RGx) can be used as a Change Notification pin (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to Vss externally.
- 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

36-Pin UQFN^(1,2,3)

■ = Pins are up to 5V tolerant

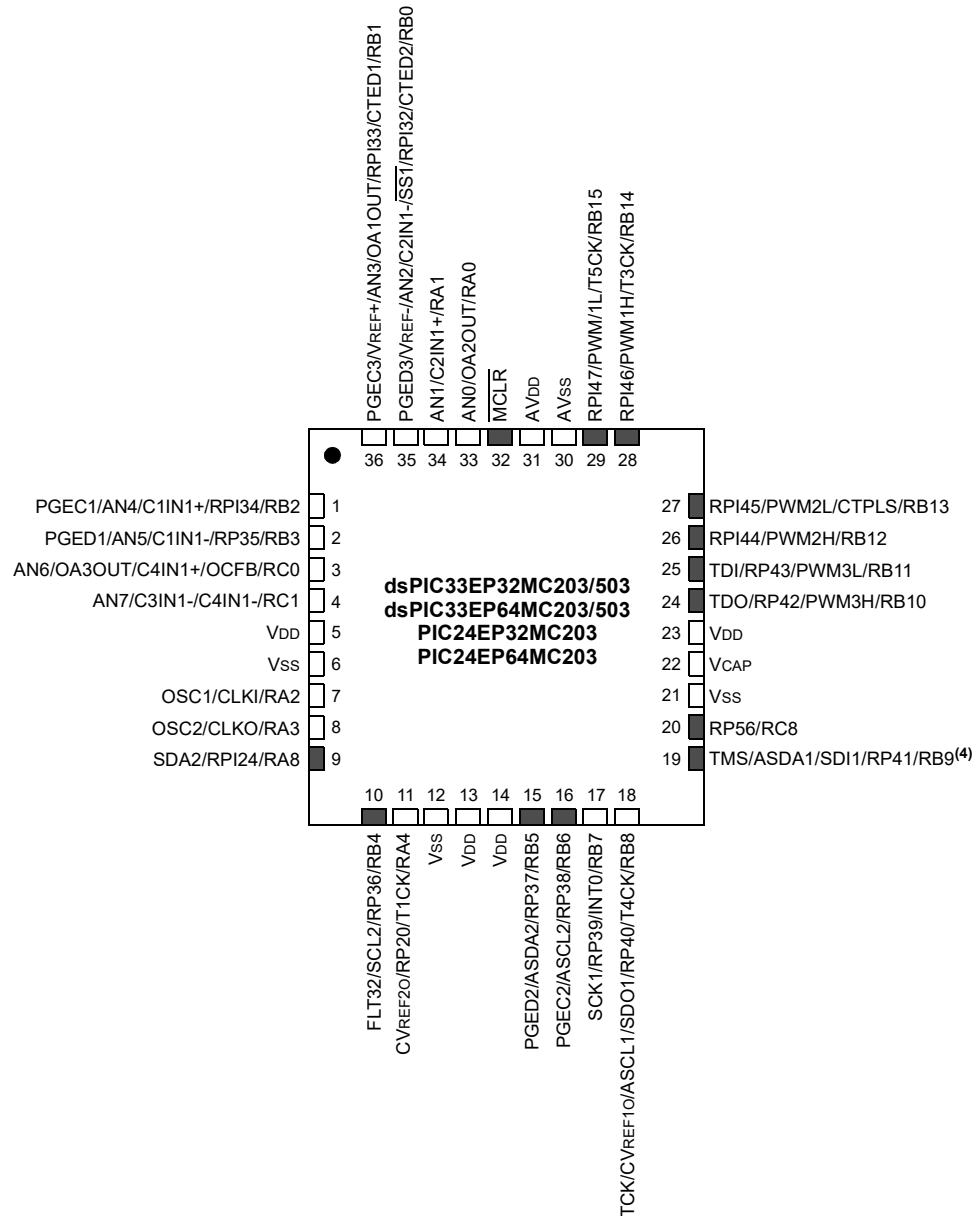

- Note 1:** The RPN/RPIn pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and information on limitations.
- Note 2:** Every I/O port pin (RAX-RGx) can be used as a Change Notification pin (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** If the op amp is selected when OPMODE (CMxCON[10]) = 1, the OAx input is used; otherwise, the ANx input is used.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

36-Pin UQFN^(1,2,3)

■ = Pins are up to 5V tolerant

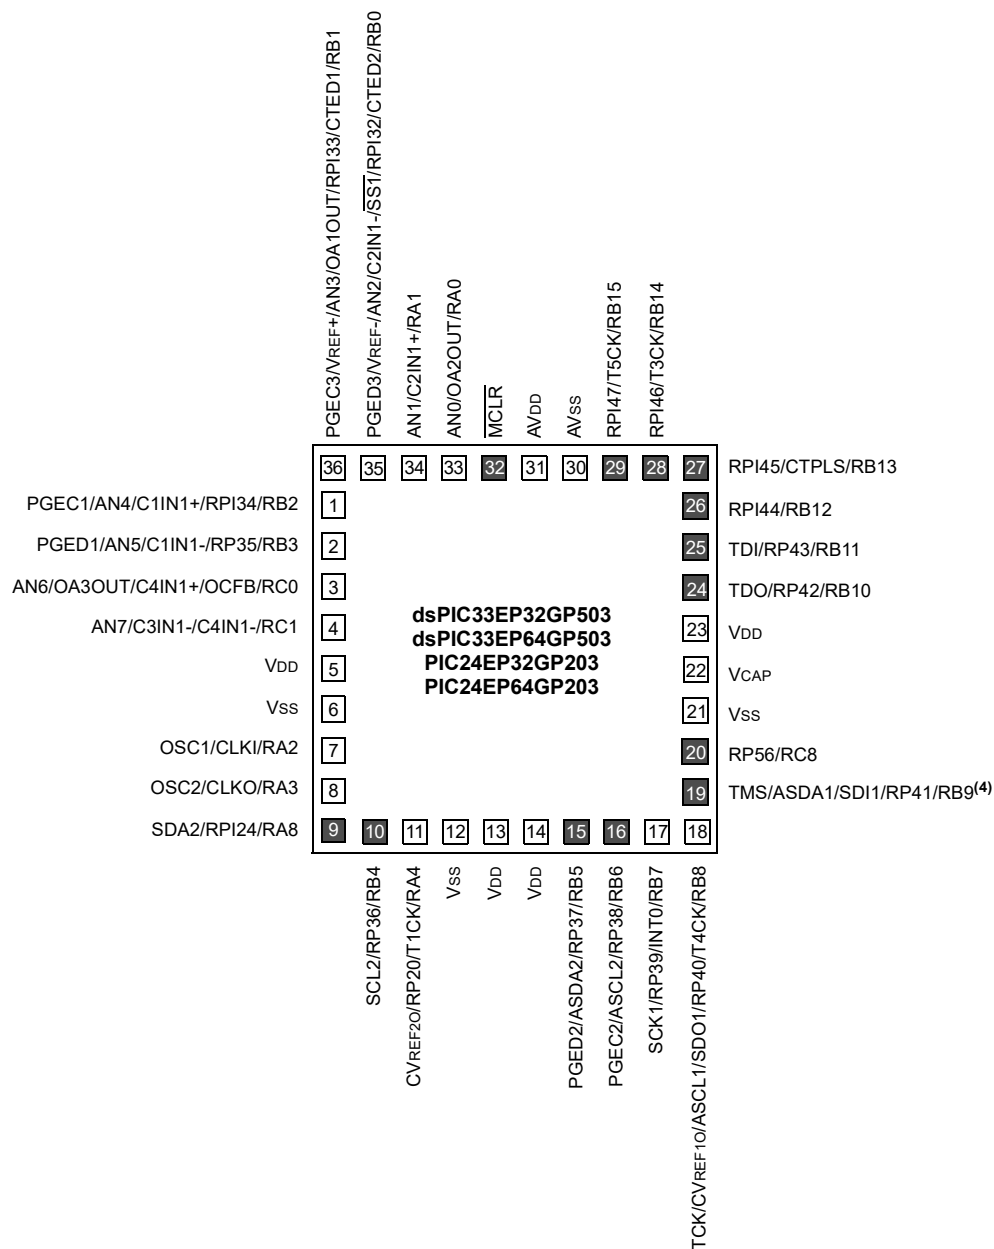

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and information on limitations.
- 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** If the op amp is selected when OPMODE (CMxCON[10]) = 1, the OAx input is used; otherwise, the ANx input is used.
- 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

36-Pin VTLA^(1,2,3)

■ = Pins are up to 5V tolerant

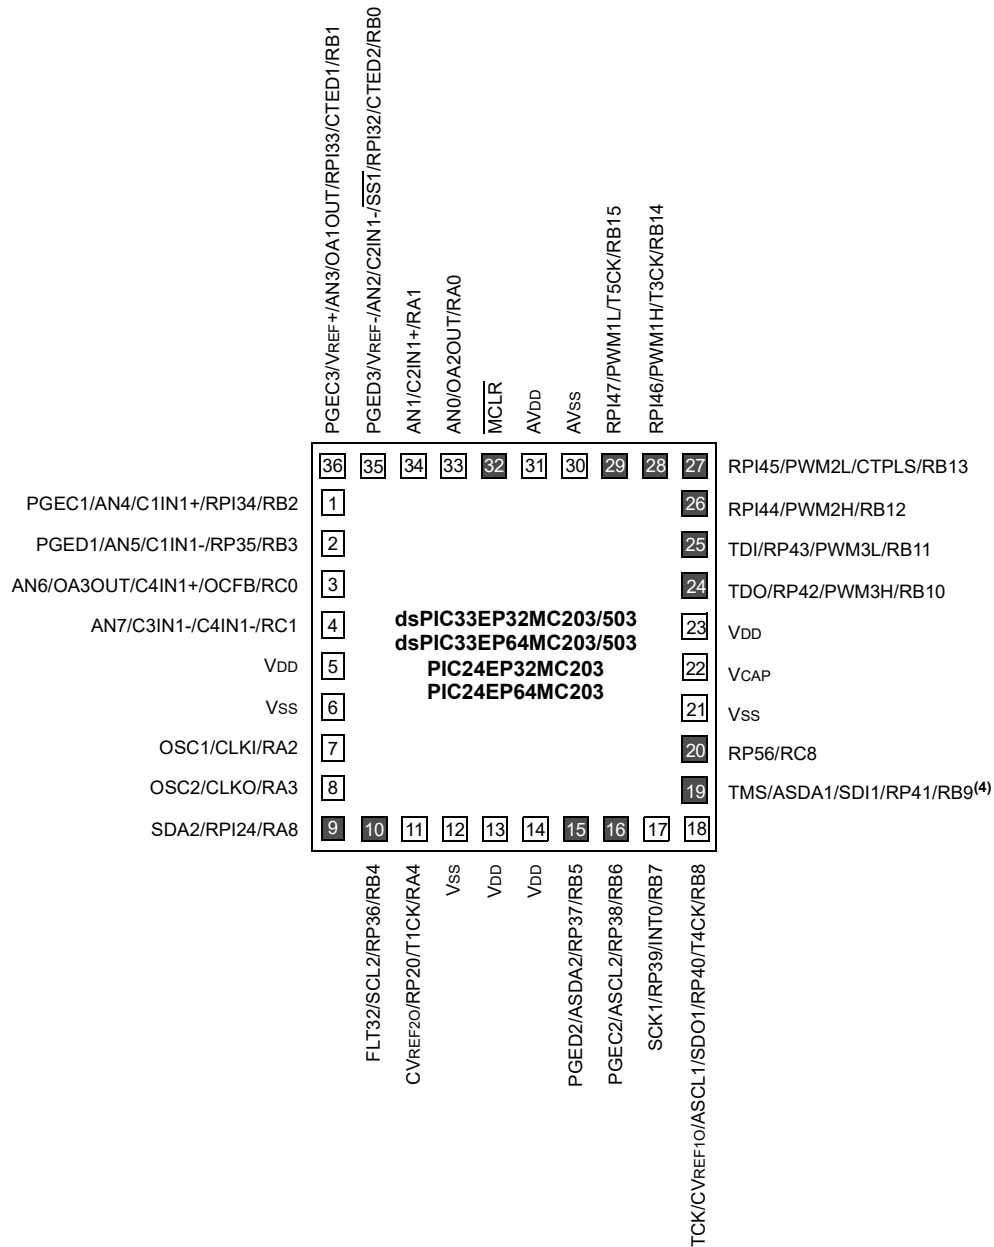

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

36-Pin VTLA^(1,2,3)

■ = Pins are up to 5V tolerant

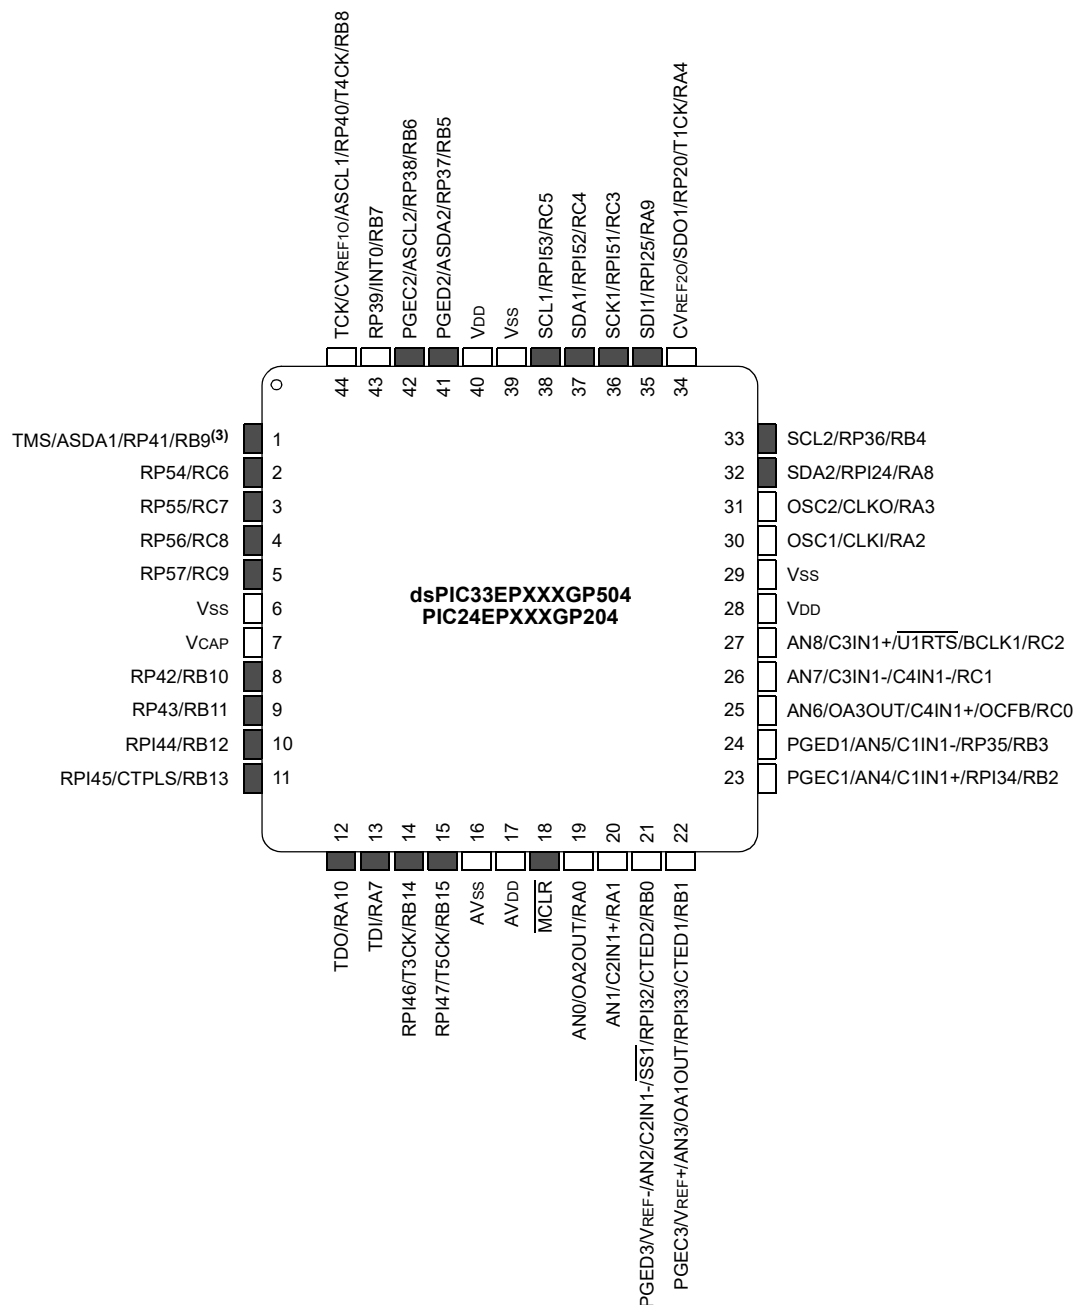

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

44-Pin TQFP^(1,2)

■ = Pins are up to 5V tolerant

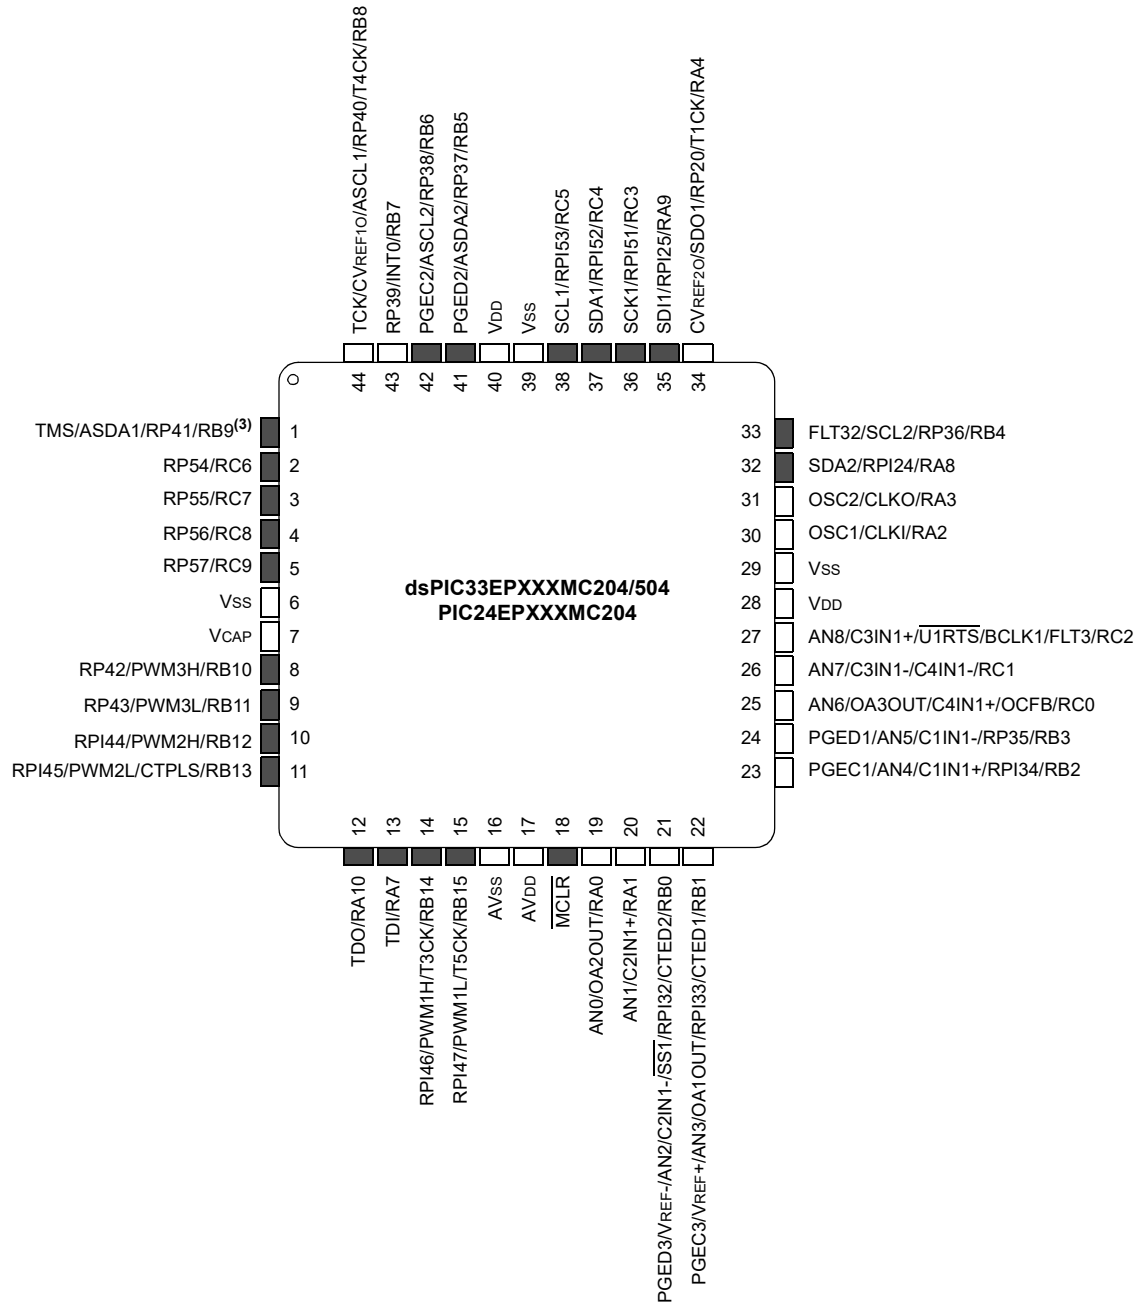

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 "Peripheral Pin Select \(PPS\)"](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 "I/O Ports"](#) for more information.
- Note 3:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

44-Pin TQFP^(1,2)

■ = Pins are up to 5V tolerant

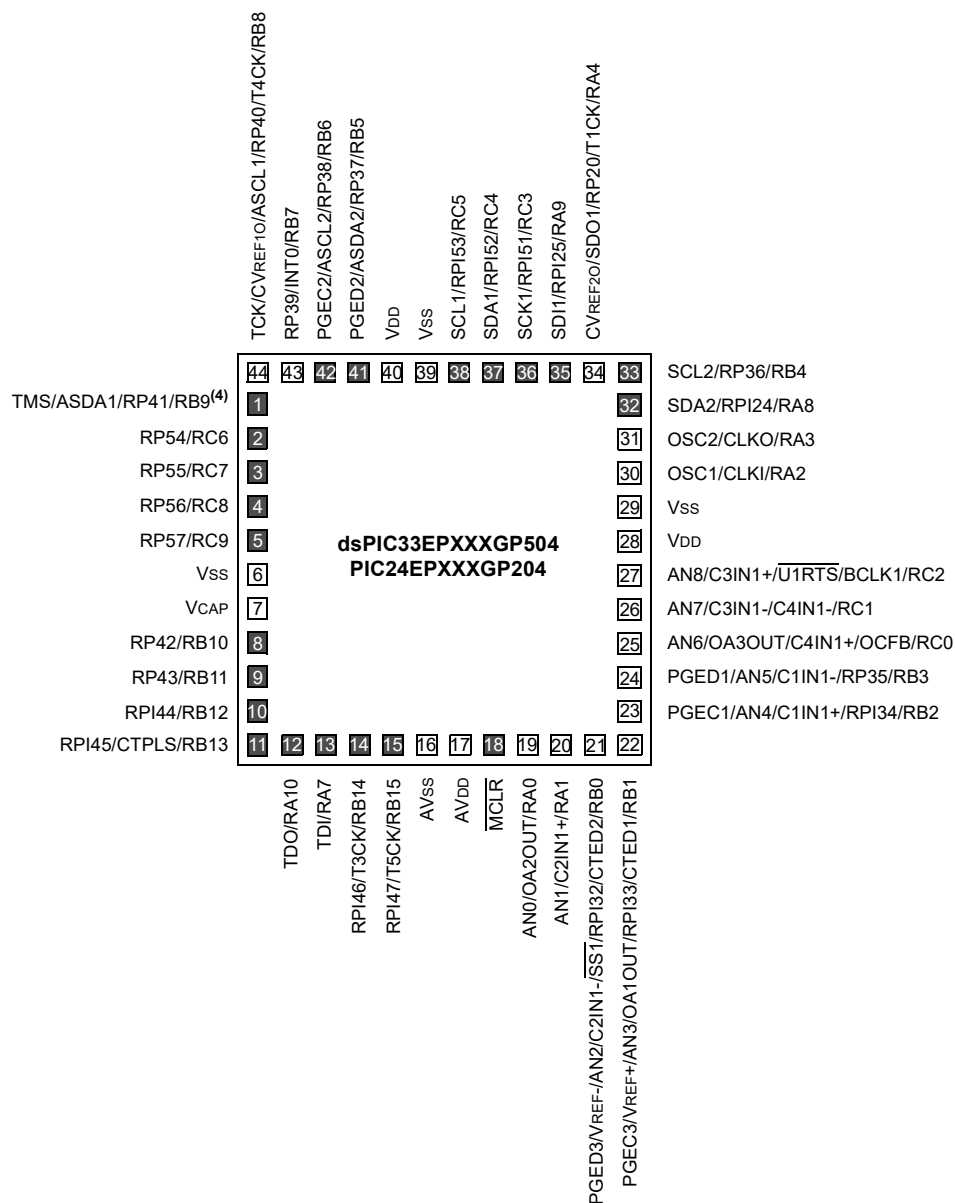

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

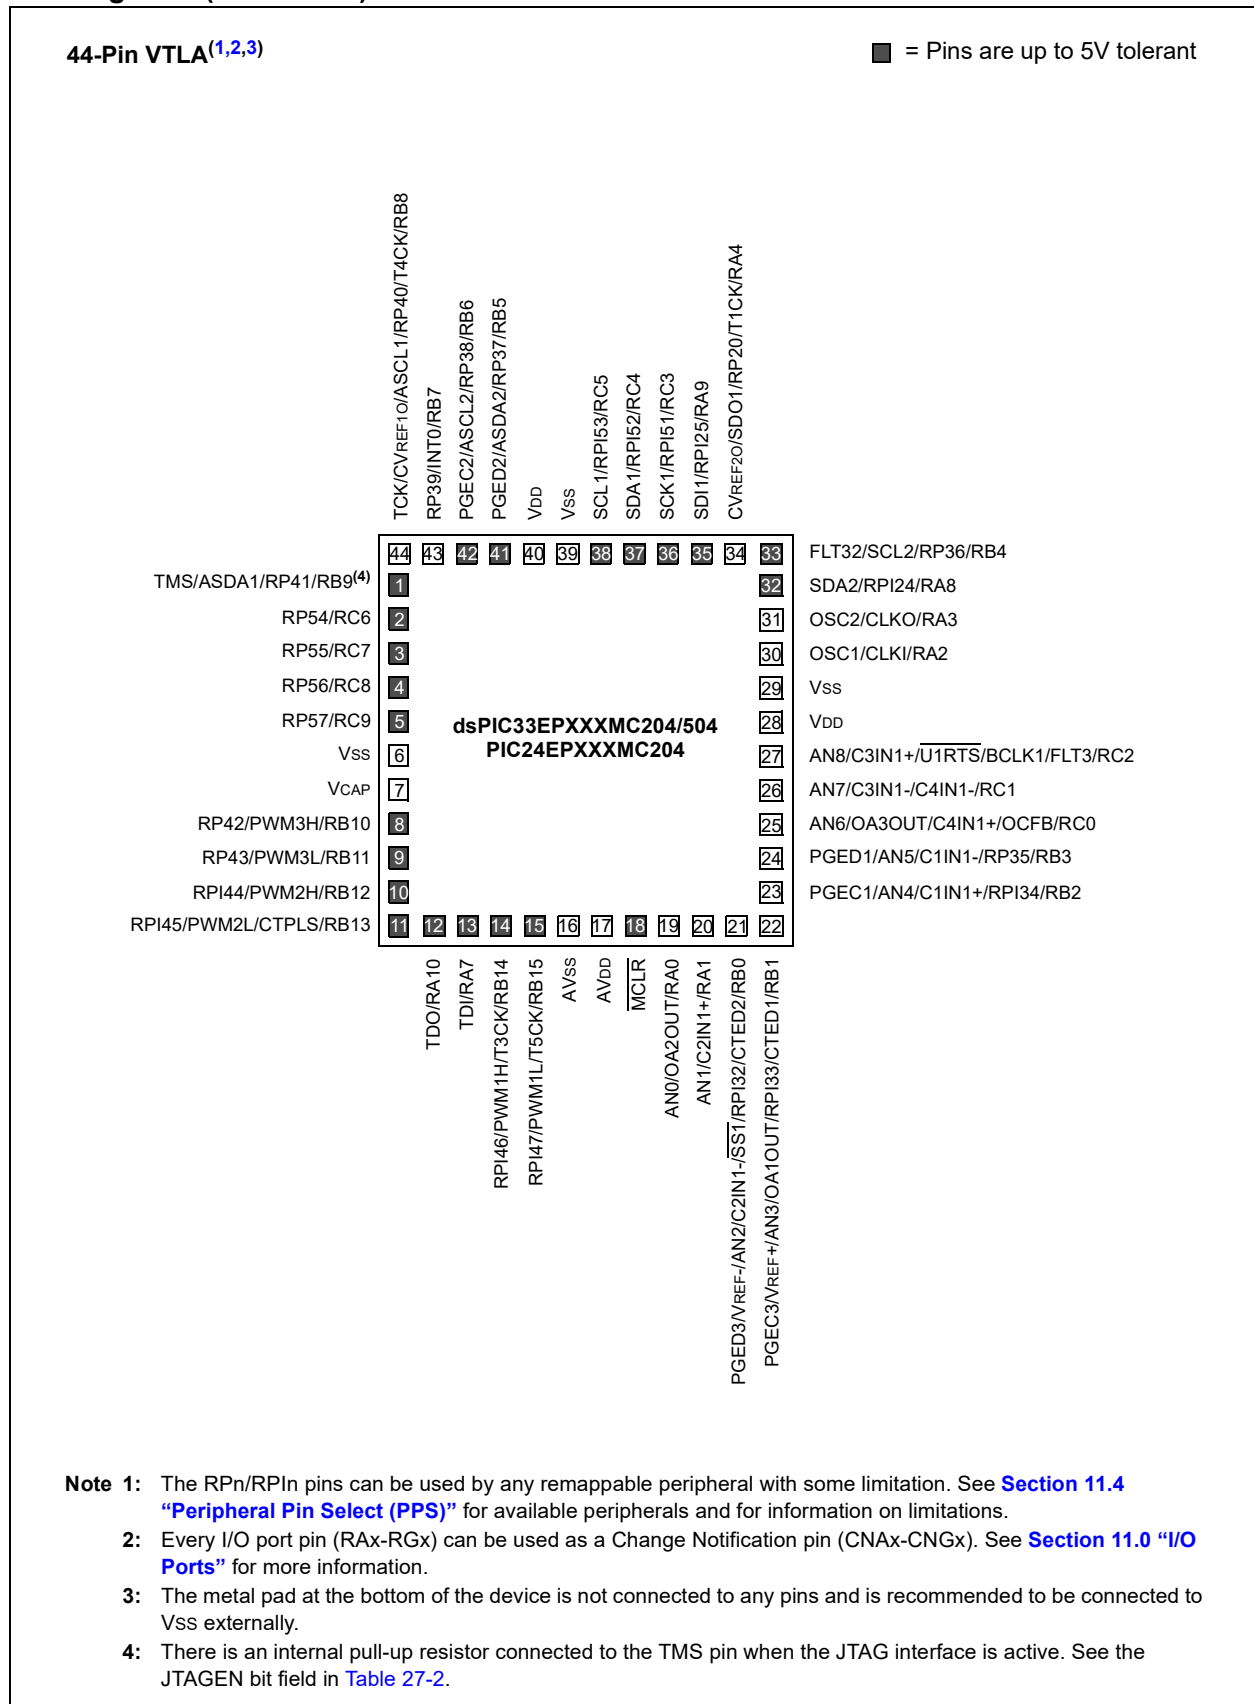

44-Pin VTLA^(1,2,3)

■ = Pins are up to 5V tolerant

- Note 1:** The RPN/RPI pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGx) can be used as a Change Notification pin (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to Vss externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

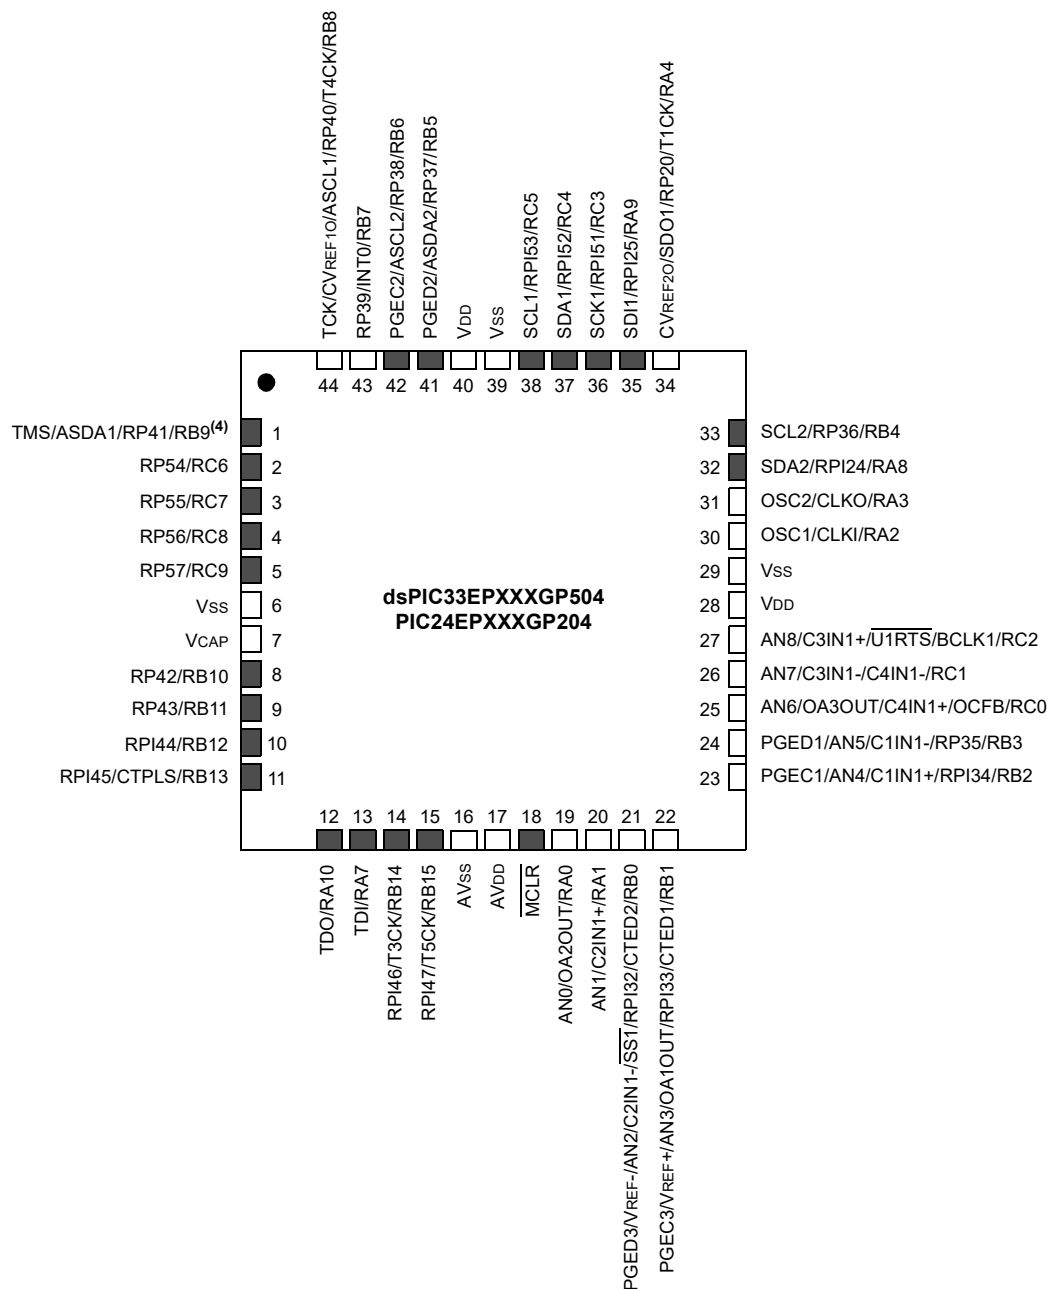

Pin Diagrams (Continued)

Pin Diagrams (Continued)

44-Pin QFN^(1,2,3)

■ = Pins are up to 5V tolerant

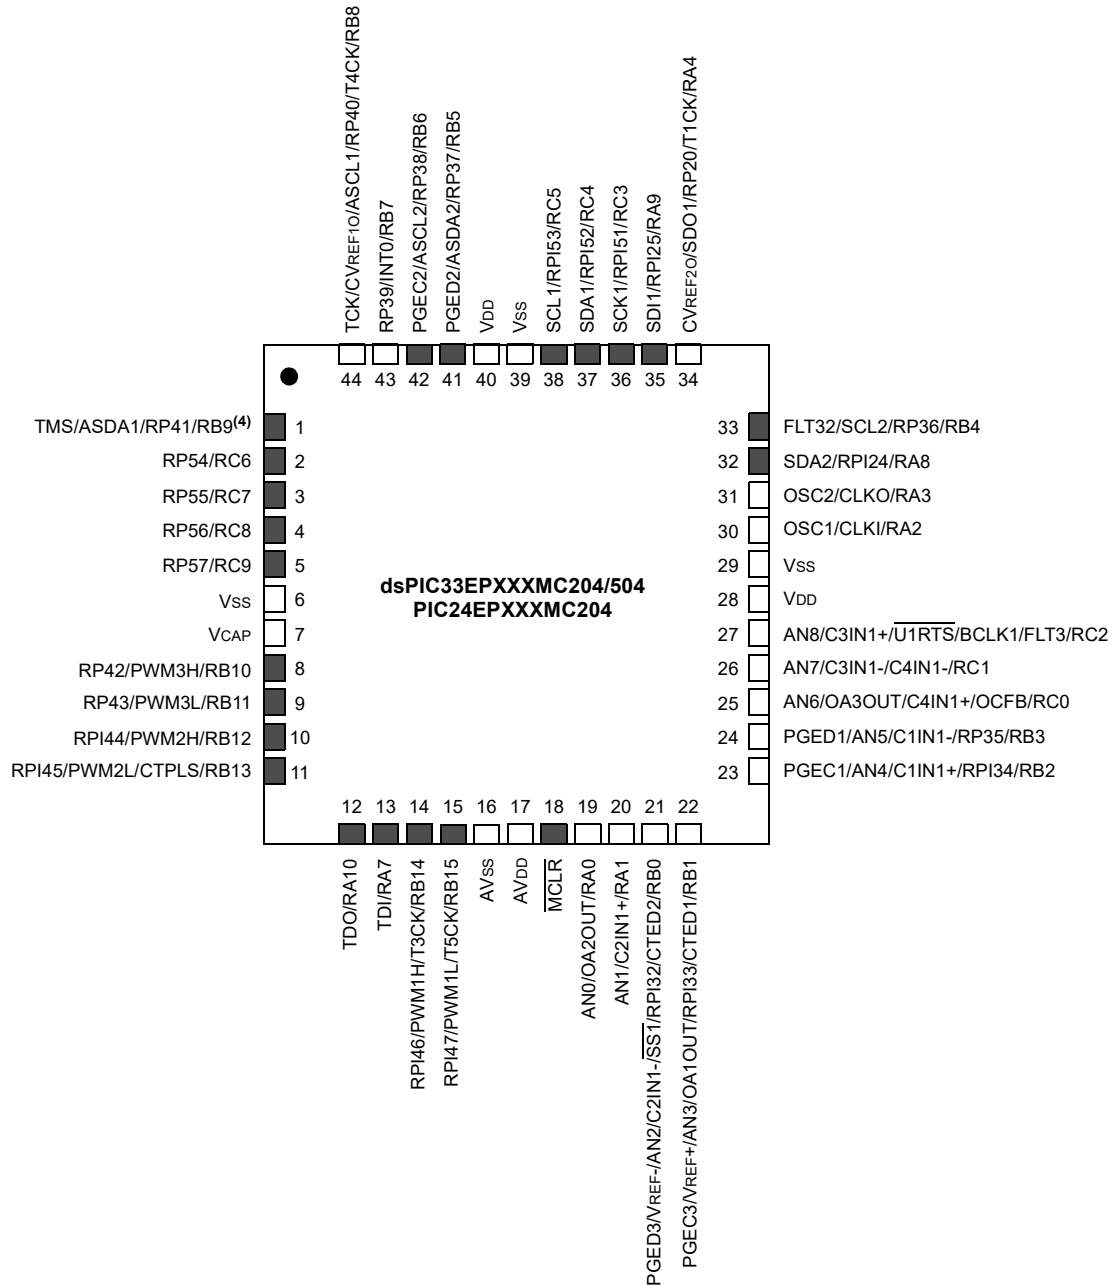

- Note 1:** The RPN/RPIn pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGx) can be used as a Change Notification pin (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

44-Pin QFN^(1,2,3)

■ = Pins are up to 5V tolerant

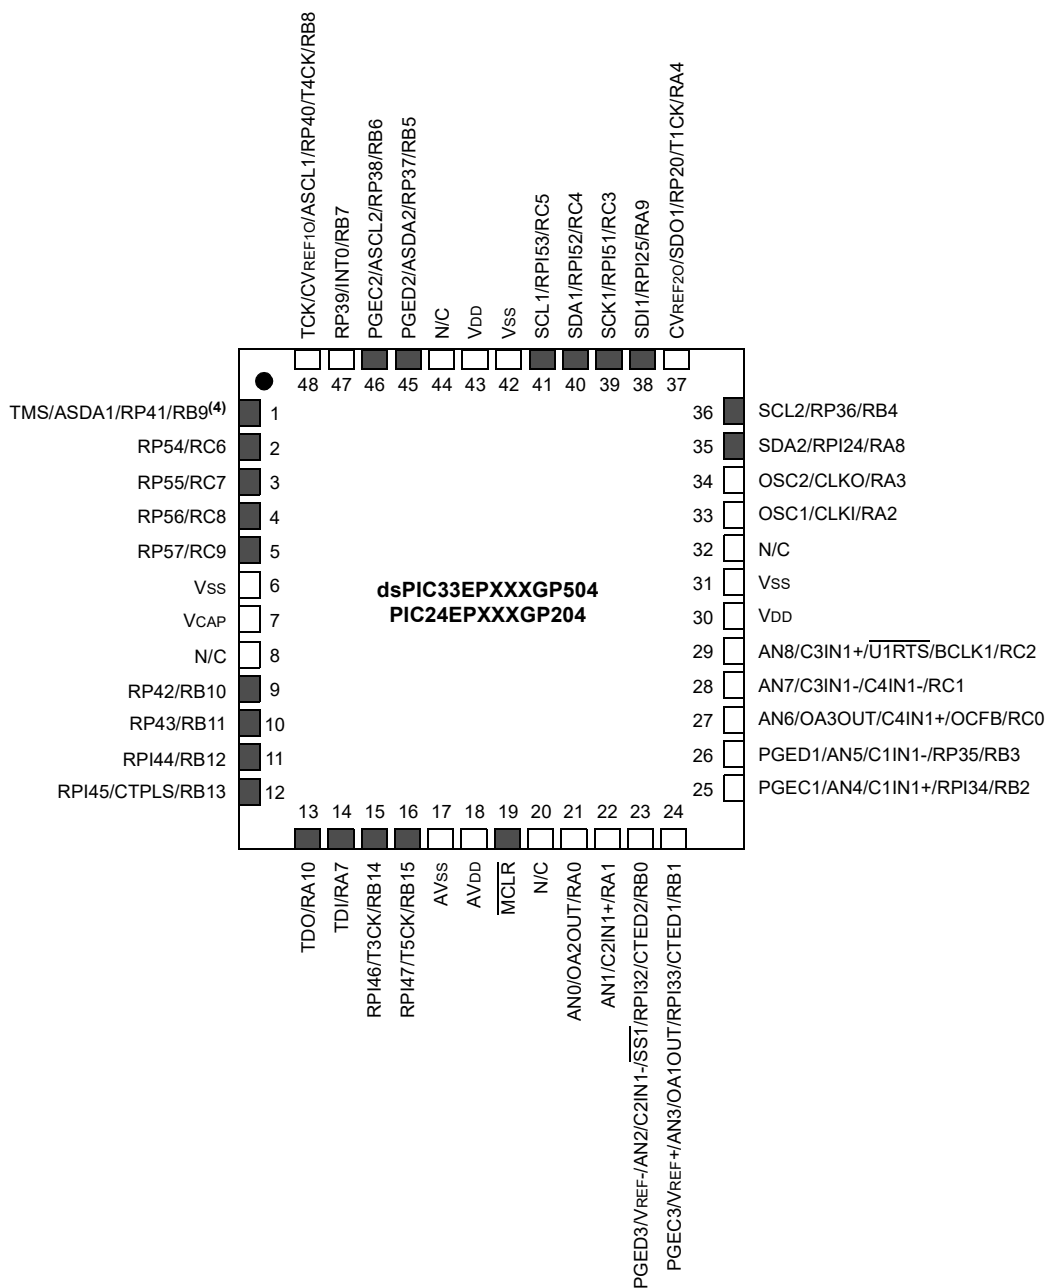

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

48-Pin UQFN^(1,2,3)

■ = Pins are up to 5V tolerant

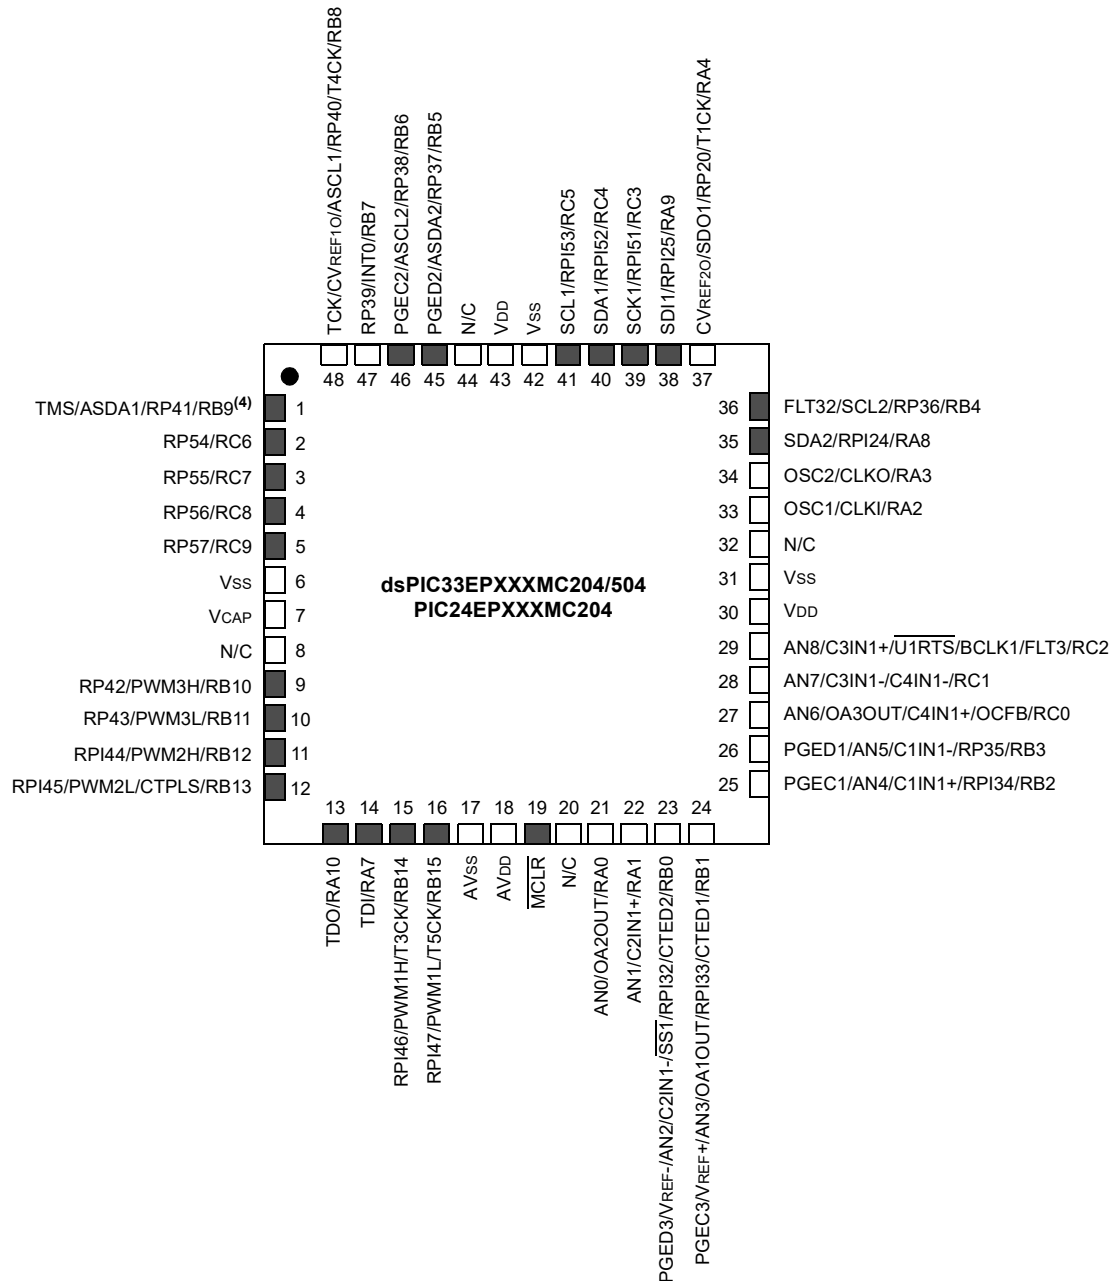

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

48-Pin UQFN^(1,2,3)

■ = Pins are up to 5V tolerant

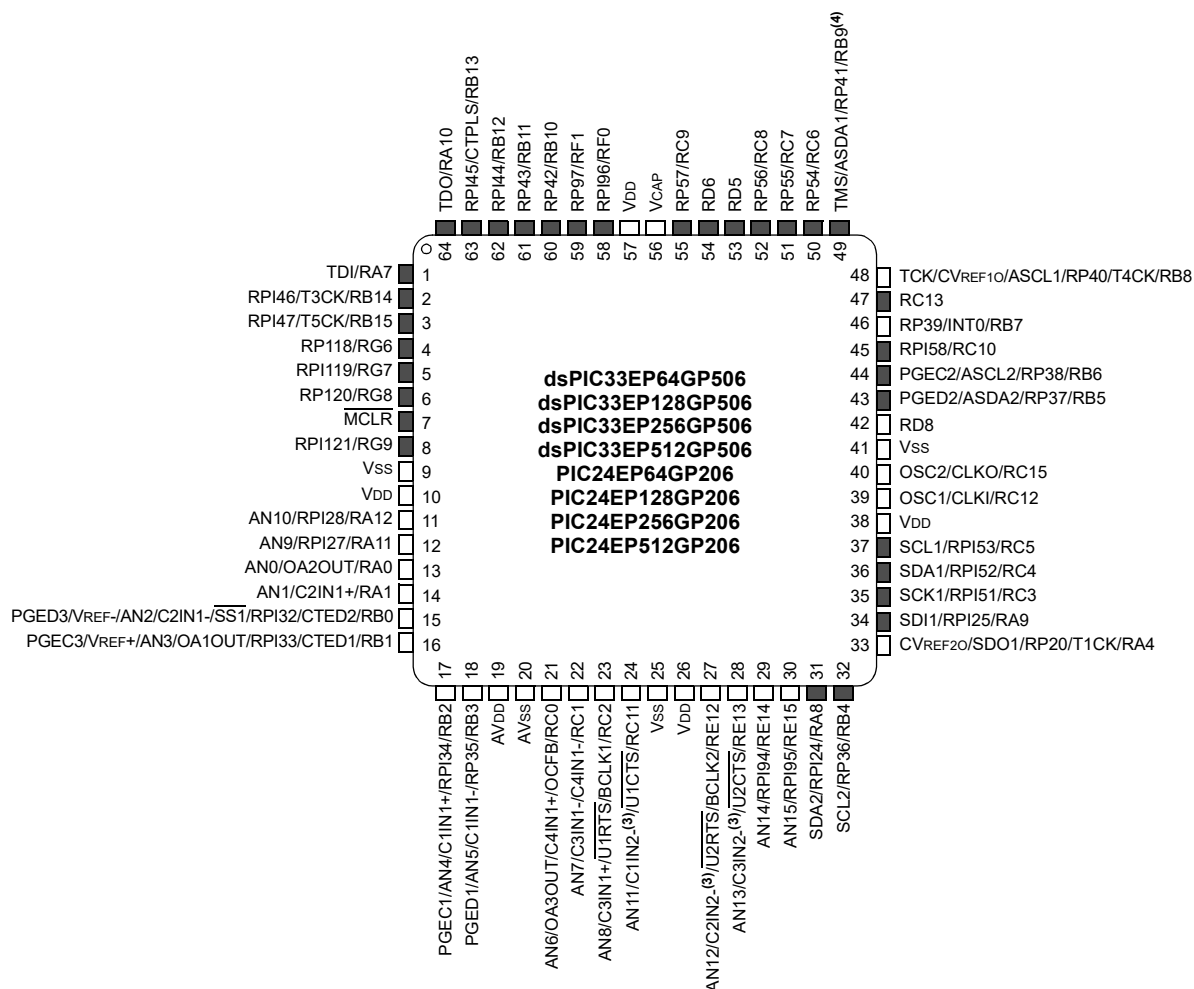

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

64-Pin TQFP^(1,2,3)

■ = Pins are up to 5V tolerant

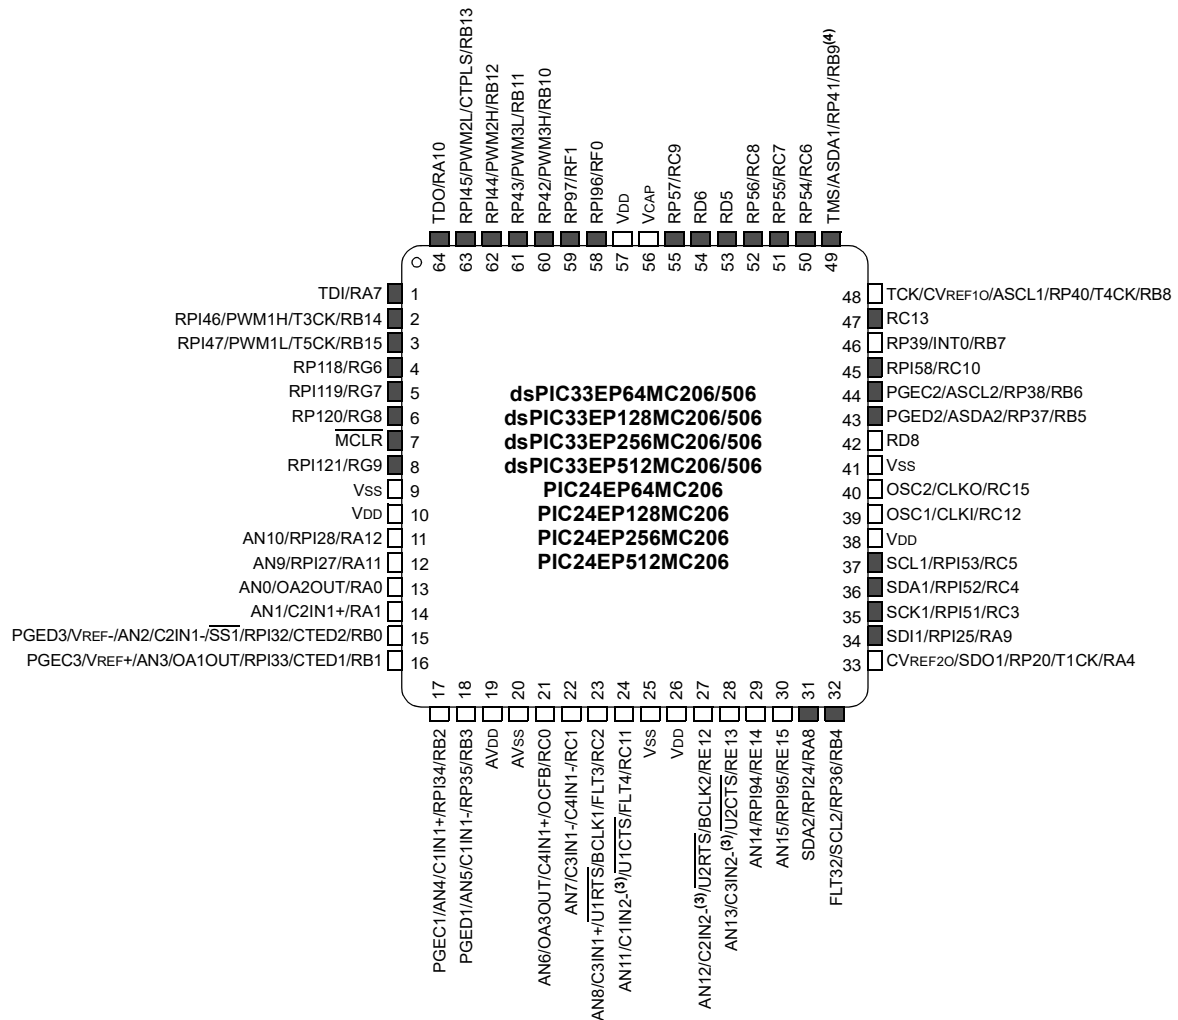

- Note 1:** The RPN/RPn pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGx) can be used as a Change Notification pin (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to Vss externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

64-Pin TQFP^(1,2,3)

■ = Pins are up to 5V tolerant

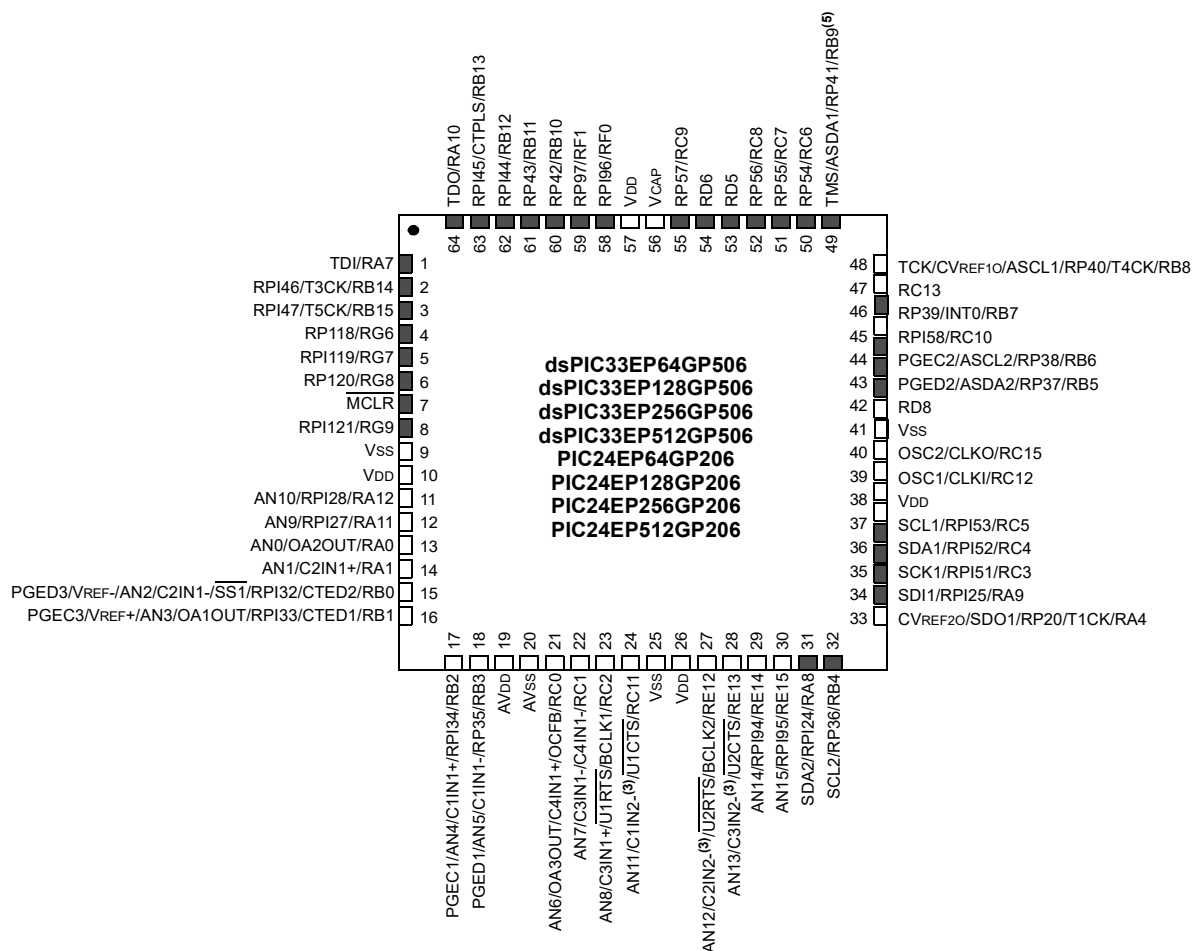

- Note 1:** The RPN/RPI pins can be used by any remappable peripheral with some limitation. See [Section 11.4 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and for information on limitations.
- Note 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to Vss externally.
- Note 4:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

Pin Diagrams (Continued)

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Website at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Website; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our website at www.microchip.com to receive the most current information on all of our products.

Referenced Sources

This device data sheet is based on the following individual chapters of the “dsPIC33/PIC24 Family Reference Manual”. These documents should be considered as the general reference for the operation of a particular module or device feature.

Note 1: To access the documents listed below, browse to the documentation section of the dsPIC33EP64MC506 product page of the Microchip website (www.microchip.com) or select a family reference manual section from the following list.

In addition to parameters, features and other documentation, the resulting page provides links to the related family reference manual sections.

1.0 DEVICE OVERVIEW

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive resource. To complement the information in this data sheet, refer to the related section of the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip website (www.microchip.com)

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

This document contains device-specific information for the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X Digital Signal Controller (DSC) and Microcontroller (MCU) devices.

dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices contain extensive Digital Signal Processor (DSP) functionality with a high-performance, 16-bit MCU architecture.

[Figure 1-1](#) shows a general block diagram of the core and peripheral modules. [Table 1-1](#) lists the functions of the various pins shown in the pinout diagrams.

FIGURE 1-1: dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X AND PIC24EPXXXGP/MC20X BLOCK DIAGRAM

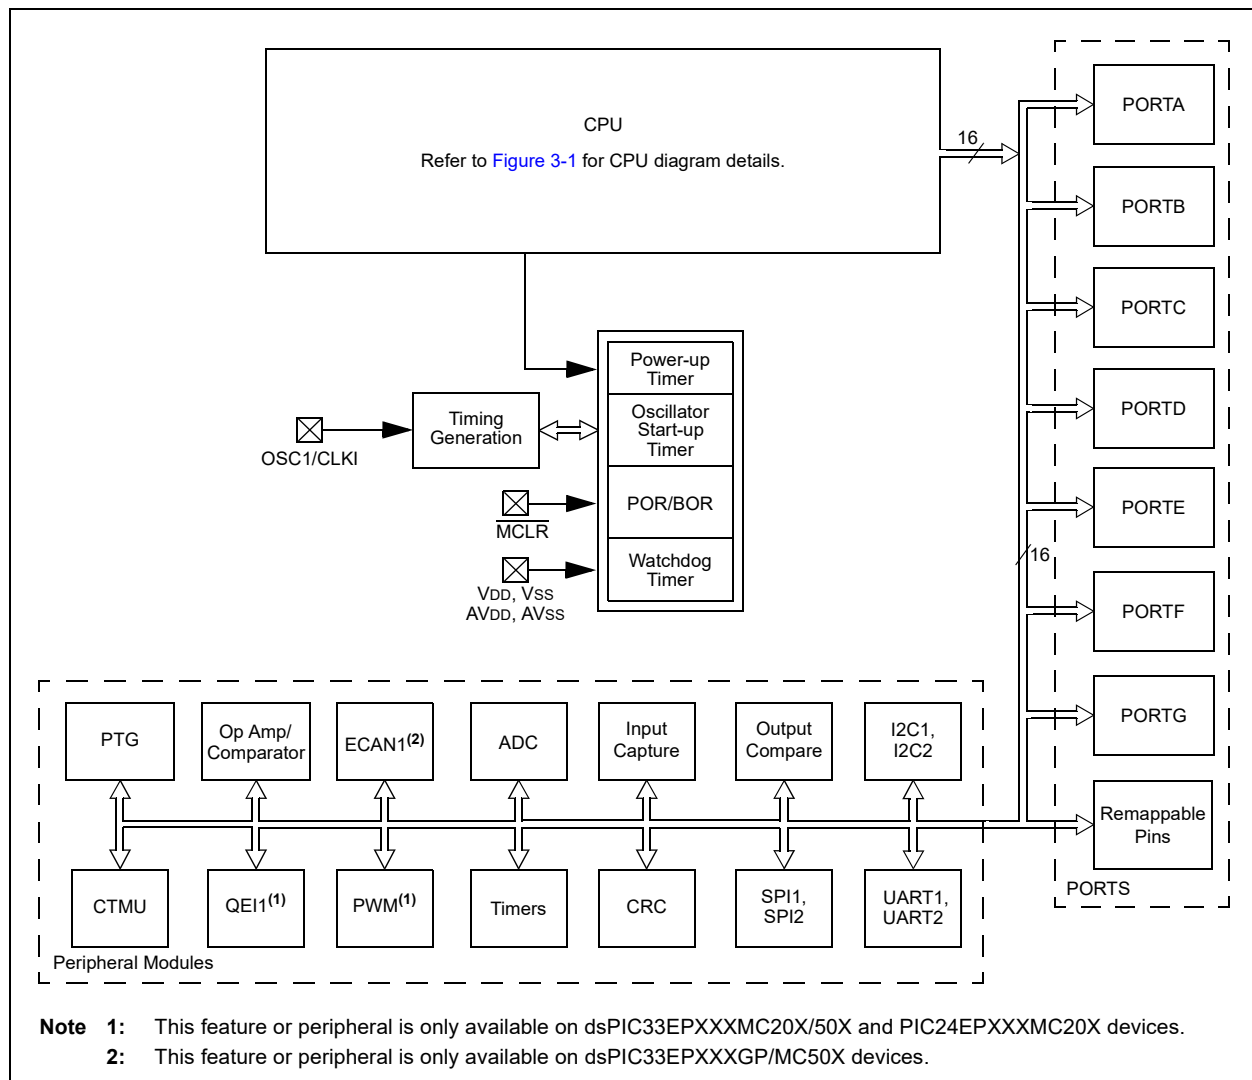

TABLE 1-1: PINOUT I/O DESCRIPTIONS

| Pin Name ⁽⁴⁾ | Pin Type | Buffer Type | PPS | Description |
|-------------------------|----------|-------------|-----|--|
| AN0-AN15 | I | Analog | No | Analog input channels. |
| CLKI | I | ST/ CMOS | No | External clock source input. Always associated with OSC1 pin function. |
| CLKO | O | — | No | Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. Always associated with OSC2 pin function. |
| OSC1 | I | ST/ CMOS | No | Oscillator crystal input. ST buffer when configured in RC mode; CMOS otherwise. |
| OSC2 | I/O | — | No | Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. |
| REFCLKO | O | — | Yes | Reference clock output. |
| IC1-IC4 | I | ST | Yes | Capture Inputs 1 through 4. |
| OCFA | I | ST | Yes | Compare Fault A input (for Compare channels). |
| OCFB | I | ST | No | Compare Fault B input (for Compare channels). |
| OC1-OC4 | O | — | Yes | Compare Outputs 1 through 4. |
| INT0 | I | ST | No | External Interrupt 0. |
| INT1 | I | ST | Yes | External Interrupt 1. |
| INT2 | I | ST | Yes | External Interrupt 2. |
| RA0-RA4, RA7-RA12 | I/O | ST | No | PORTA is a bidirectional I/O port. |
| RB0-RB15 | I/O | ST | No | PORTB is a bidirectional I/O port. |
| RC0-RC13, RC15 | I/O | ST | No | PORTC is a bidirectional I/O port. |
| RD5, RD6, RD8 | I/O | ST | No | PORTD is a bidirectional I/O port. |
| RE12-RE15 | I/O | ST | No | PORTE is a bidirectional I/O port. |
| RF0, RF1 | I/O | ST | No | PORTF is a bidirectional I/O port. |
| RG6-RG9 | I/O | ST | No | PORTG is a bidirectional I/O port. |
| T1CK | I | ST | No | Timer1 external clock input. |
| T2CK | I | ST | Yes | Timer2 external clock input. |
| T3CK | I | ST | No | Timer3 external clock input. |
| T4CK | I | ST | No | Timer4 external clock input. |
| T5CK | I | ST | No | Timer5 external clock input. |
| CTPLS | O | ST | No | CTMU pulse output. |
| CTED1 | I | ST | No | CTMU External Edge Input 1. |
| CTED2 | I | ST | No | CTMU External Edge Input 2. |
| U1CTS | I | ST | No | UART1 Clear-to-Send. |
| U1RTS | O | — | No | UART1 Ready-to-Send. |
| U1RX | I | ST | Yes | UART1 receive. |
| U1TX | O | — | Yes | UART1 transmit. |
| BCLK1 | O | ST | No | UART1 IrDA [®] baud clock output. |

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power

- Note 5:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTAGEN bit field in [Table 27-2](#).

2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT DIGITAL SIGNAL CONTROLLERS AND MICROCONTROLLERS

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip website (www.microchip.com)

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

2.1 Basic Connection Requirements

Getting started with the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins
(see [Section 2.2 “Decoupling Capacitors”](#))
- All AVDD and AVSS pins (regardless if ADC module is not used)
(see [Section 2.2 “Decoupling Capacitors”](#))
- VCAP
(see [Section 2.3 “CPU Logic Filter Capacitor Connection \(VCAP\)”](#))
- MCLR pin
(see [Section 2.4 “Master Clear \(MCLR\) Pin”](#))
- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes
(see [Section 2.5 “ICSP Pins”](#))
- OSC1 and OSC2 pins when external oscillator source is used
(see [Section 2.6 “External Oscillator Pins”](#))

Additionally, the following pins may be required:

- VREF+/VREF- pins are used when external voltage reference for the ADC module is implemented

Note: The AVDD and AVSS pins must be connected, independent of the ADC voltage reference source.

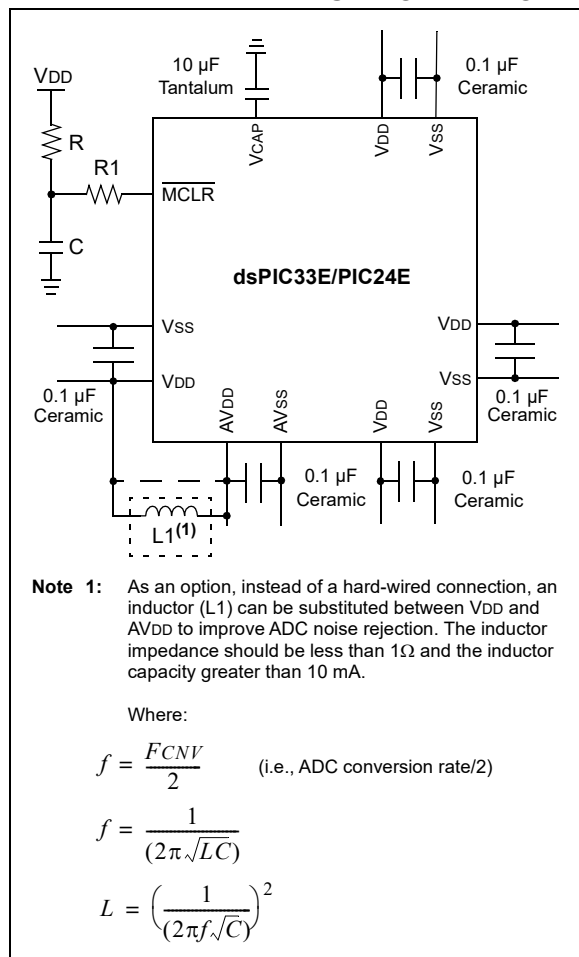

2.2 Decoupling Capacitors

The use of decoupling capacitors on every pair of power supply pins, such as VDD, VSS, AVDD and AVSS is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** Recommendation of 0.1 μF (100 nF), 10-20V. This capacitor should be a low-ESR and have resonance frequency in the range of 20 MHz and higher. It is recommended to use ceramic capacitors.
- **Placement on the Printed Circuit Board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high-frequency noise:** If the board is experiencing high-frequency noise, above tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μF to 0.001 μF . Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 μF in parallel with 0.001 μF .
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB track inductance.

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION

2.2.1 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits including DSCs to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 µF to 47 µF.

2.3 CPU Logic Filter Capacitor Connection (VCAP)

A low-ESR (< 1 Ohm) capacitor is required on the VCAP pin, which is used to stabilize the voltage regulator output voltage. The VCAP pin must not be connected to VDD and must have a capacitor greater than 4.7 µF (10 µF is recommended), 16V connected to ground. The type can be ceramic or tantalum. See [Section 30.0 "Electrical Characteristics"](#) for additional information.

The placement of this capacitor should be close to the VCAP pin. It is recommended that the trace length not exceeds one-quarter inch (6 mm). See [Section 27.3 "On-Chip Voltage Regulator"](#) for details.

2.4 Master Clear (MCLR) Pin

The MCLR pin provides two specific device functions:

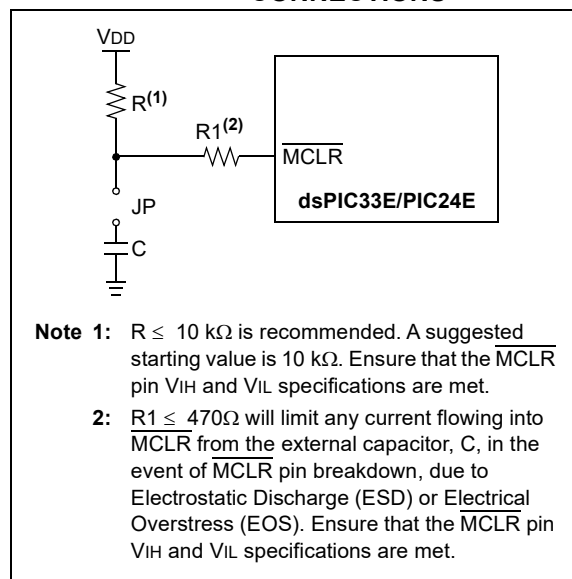

- Device Reset
- Device Programming and Debugging.

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the MCLR pin. Consequently, specific voltage levels (VIH and VIL) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in [Figure 2-2](#), it is recommended that the capacitor, C, be isolated from the MCLR pin during programming and debugging operations.

Place the components as shown in [Figure 2-2](#) within one-quarter inch (6 mm) from the MCLR pin.

FIGURE 2-2: EXAMPLE OF MCLR PIN CONNECTIONS

2.5 ICSP Pins

The PGECx and PGEDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes, and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin Voltage Input High (V_{IH}) and Voltage Input Low (V_{IL}) requirements.

Ensure that the “Communication Channel Select” (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® PICKIT™ 3, MPLAB ICD 3 or MPLAB REAL ICE™.

For more information on MPLAB ICD 2, ICD 3 and REAL ICE connection requirements, refer to the following documents that are available on the Microchip website.

- “Using MPLAB® ICD 3” (poster) DS51765
- “MPLAB® ICD 3 Design Advisory” DS51764
- “MPLAB® REAL ICE™ In-Circuit Emulator User’s Guide” DS51616
- “Using MPLAB® REAL ICE™ In-Circuit Emulator” (poster) DS51749

2.6 External Oscillator Pins

Many DSCs have options for at least two oscillators: a high-frequency Primary Oscillator and a low-frequency Secondary Oscillator. For details, see [Section 9.0 “Oscillator Configuration”](#) for details.

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is shown in [Figure 2-3](#).

FIGURE 2-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT

2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to a certain frequency (see [Section 9.0 “Oscillator Configuration”](#)) to comply with device PLL start-up conditions. This means that if the external oscillator frequency is outside this range, the application must start up in the FRC mode first. The default PLL settings after a POR with an oscillator frequency outside this range will violate the device operating speed.

Once the device powers up, the application firmware can initialize the PLL SFRs, CLKDIV and PLLFBD, to a suitable value, and then perform a clock switch to the Oscillator + PLL clock source. Note that clock switching must be enabled in the device Configuration Word.

2.8 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic low state.

Alternatively, connect a 1k to 10k resistor between Vss and unused pins, and drive the output to logic low.

2.9 Application Examples

- Induction heating
- Uninterruptable Power Supplies (UPS)
- DC/AC inverters
- Compressor motor control
- Washing machine 3-phase motor control
- BLDC motor control
- Automotive HVAC, cooling fans, fuel pumps
- Stepper motor control
- Audio and fluid sensor monitoring
- Camera lens focus and stability control
- Speech (playback, hands-free kits, answering machines, VoIP)
- Consumer audio
- Industrial and building control (security systems and access control)
- Barcode reading
- Networking: LAN switches, gateways
- Data storage device management
- Smart cards and smart card readers

Examples of typical application connections are shown in [Figure 2-4](#) through [Figure 2-8](#).

3.0 CPU

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**CPU**” (www.microchip.com/DS70359) in the “dsPIC33/PIC24 Family Reference Manual”.

- 2:** Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X CPU has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for digital signal processing. The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space.

An instruction prefetch mechanism helps maintain throughput and provides predictable execution. Most instructions execute in a single-cycle effective execution rate, with the exception of instructions that change the program flow, the double-word move (MOV.D) instruction, PSV accesses and the table instructions. Overhead-free program loop constructs are supported using the DO and REPEAT instructions, both of which are interruptible at any point.

3.1 Registers

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices have sixteen, 16-bit Working registers in the programmer’s model. Each of the Working registers can act as a data, address or address offset register. The 16th Working register (W15) operates as a Software Stack Pointer (SSP) for interrupts and calls.

3.2 Instruction Set

The instruction set for dsPIC33EPXXXGP50X and dsPIC33EPXXXMC20X/50X devices has two classes of instructions: the MCU class of instructions and the DSP class of instructions. The instruction set for PIC24EPXXXGP/MC20X devices has the MCU class of instructions only and does not support DSP instructions. These two instruction classes are seamlessly integrated into the architecture and execute from a single execution unit. The instruction set includes many addressing modes and was designed for optimum C compiler efficiency.

3.3 Data Space Addressing

The base Data Space can be addressed as 64 Kbytes (32K words).

The Data Space includes two ranges of memory, referred to as X and Y data memory. Each memory range is accessible through its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear Data Space. On dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices, certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y Data Spaces have memory locations that are device-specific, and are described further in the data memory maps in [Section 4.2 “Data Address Space”](#).

The upper 32 Kbytes of the Data Space memory map can optionally be mapped into Program Space (PS) at any 32-Kbyte aligned program word boundary. The Program-to-Data Space mapping feature, known as Program Space Visibility (PSV), lets any instruction access Program Space as if it were Data Space. Moreover, the Base Data Space address is used in conjunction with a Read or Write Page register (DSRPAG or DSWPAG) to form an Extended Data Space (EDS) address. The EDS can be addressed as 8M words or 16 Mbytes. Refer to the “**Data Memory**” (www.microchip.com/DS70595) and “**dsPIC33/PIC24 Program Memory**” (www.microchip.com/DS70000613) sections in the “dsPIC33/PIC24 Family Reference Manual” for more details on EDS, PSV and table accesses.

On the dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices, overhead-free circular buffers (Modulo Addressing) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. The X AGU Circular Addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data re-ordering for radix-2 FFT algorithms. PIC24EPXXXGP/MC20X devices do not support Modulo and Bit-Reversed Addressing.

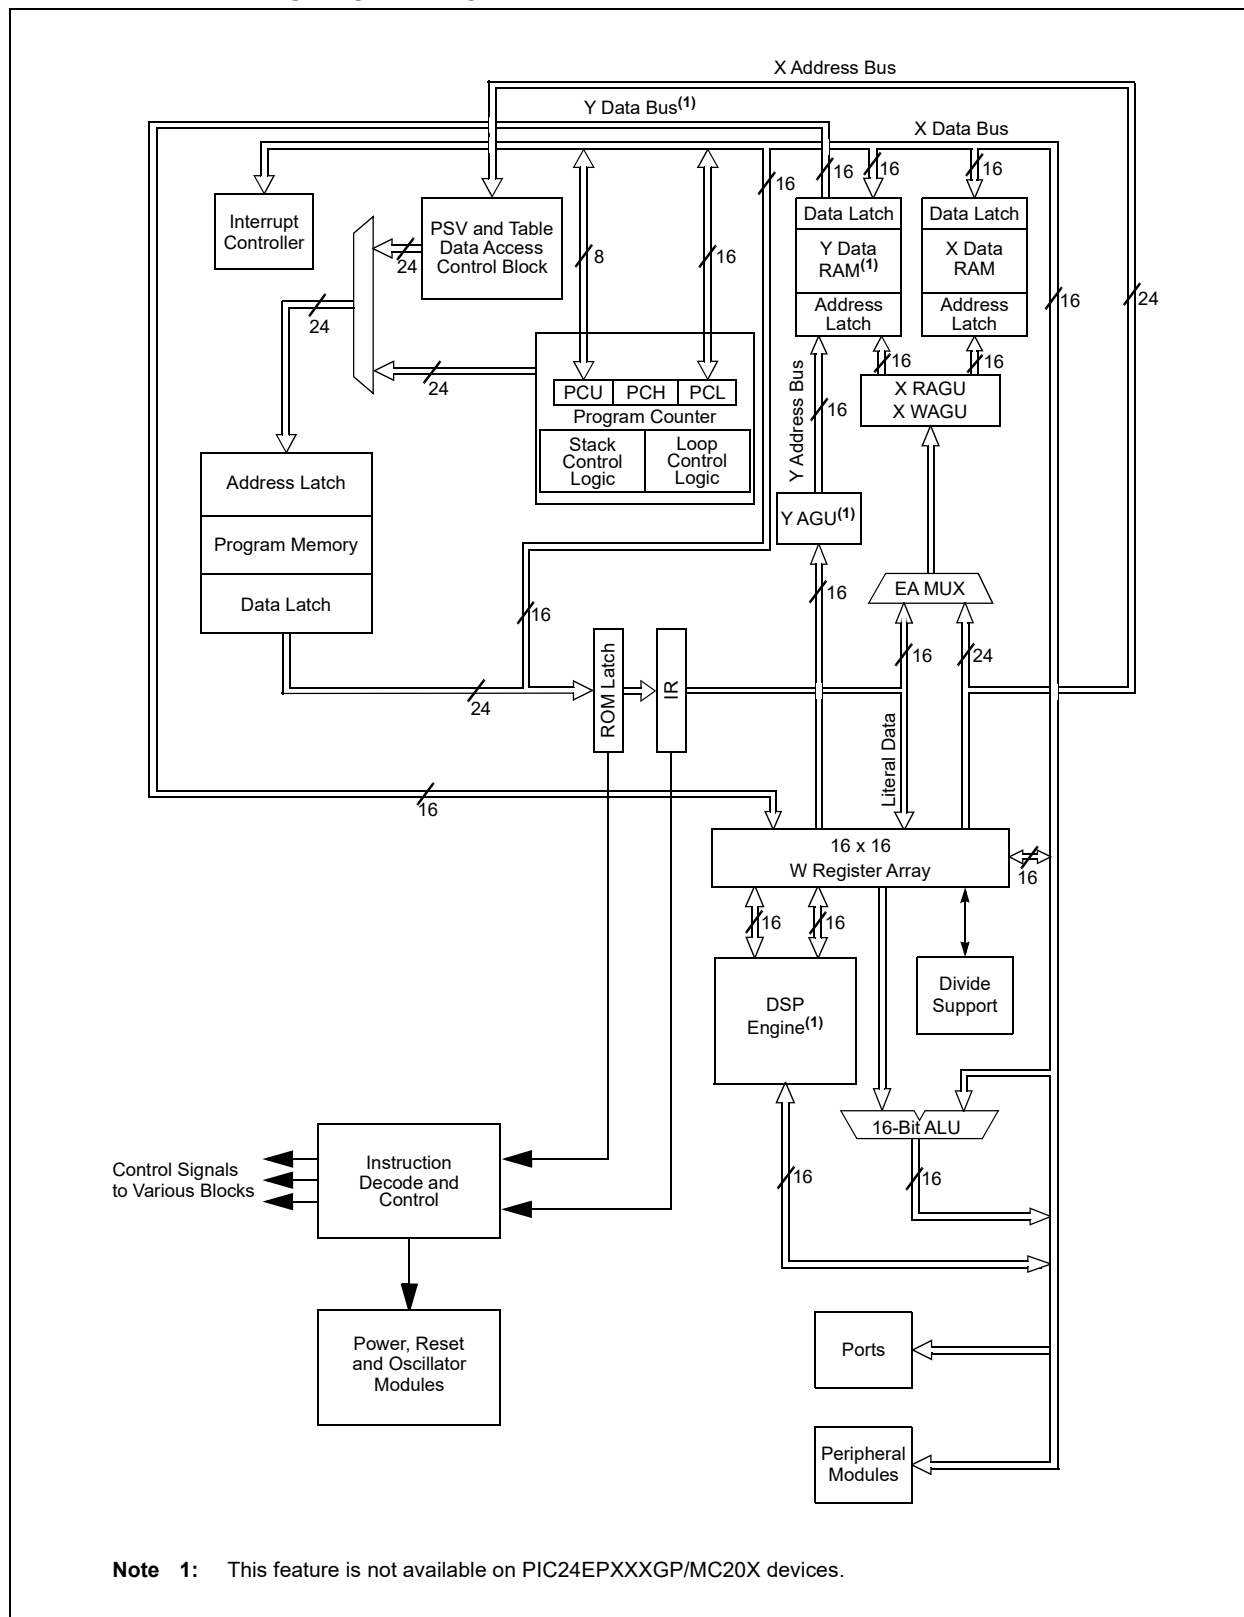

3.4 Addressing Modes

The CPU supports these addressing modes:

- Inherent (no operand)
- Relative
- Literal
- Memory Direct
- Register Direct
- Register Indirect

Each instruction is associated with a predefined addressing mode group, depending upon its functional requirements. As many as six addressing modes are supported for each instruction.

FIGURE 3-1: dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X AND PIC24EPXXXGP/MC20X CPU BLOCK DIAGRAM

3.5 Programmer's Model

The programmer's model for the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X is shown in [Figure 3-2](#). All registers in the programmer's model are memory-mapped and can be manipulated directly by instructions. [Table 3-1](#) lists a description of each register.

In addition to the registers contained in the programmer's model, the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/

MC20X devices contain control registers for Modulo Addressing (dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices only), Bit-Reversed Addressing (dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices only) and interrupts. These registers are described in subsequent sections of this document.

All registers associated with the programmer's model are memory-mapped, as shown in [Table 4-1](#).

TABLE 3-1: PROGRAMMER'S MODEL REGISTER DESCRIPTIONS

| Register(s) Name | Description |
|---|---|
| W0 through W15 | Working Register Array |
| ACCA, ACCB | 40-Bit DSP Accumulators |
| PC | 23-Bit Program Counter |
| SR | ALU and DSP Engine STATUS Register |
| SPLIM | Stack Pointer Limit Value Register |
| TBLPAG | Table Memory Page Address Register |
| DSRPAG | Extended Data Space (EDS) Read Page Register |
| DSWPAG | Extended Data Space (EDS) Write Page Register |
| RCOUNT | REPEAT Loop Counter Register |
| DCOUNT ⁽¹⁾ | DO Loop Counter Register |
| DOSTARTH ^(1,2) , DOSTARTL ^(1,2) | DO Loop Start Address Register (High and Low) |
| DOENDH ⁽¹⁾ , DOENDL ⁽¹⁾ | DO Loop End Address Register (High and Low) |
| CORCON | Contains DSP Engine, DO Loop Control and Trap Status bits |

Note 1: This register is available on dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices only.

2: The DOSTARTH and DOSTARTL registers are read-only.

| Legend: | C = Clearable bit |
| R = Readable bit | W = Writable bit |
| -n = Value at POR | '1' = Bit is set |
| | U = Unimplemented bit, read as '0' |
| | '0' = Bit is cleared |
| | x = Bit is unknown |

- bit 15 **OA:** Accumulator A Overflow Status bit⁽¹⁾
 1 = Accumulator A has overflowed
 0 = Accumulator A has not overflowed
- bit 14 **OB:** Accumulator B Overflow Status bit⁽¹⁾
 1 = Accumulator B has overflowed
 0 = Accumulator B has not overflowed
- bit 13 **SA:** Accumulator A Saturation 'Sticky' Status bit^(1,4)
 1 = Accumulator A is saturated or has been saturated at some time
 0 = Accumulator A is not saturated
- bit 12 **SB:** Accumulator B Saturation 'Sticky' Status bit^(1,4)
 1 = Accumulator B is saturated or has been saturated at some time
 0 = Accumulator B is not saturated
- bit 11 **OAB:** OA || OB Combined Accumulator Overflow Status bit⁽¹⁾
 1 = Accumulators A or B have overflowed
 0 = Neither Accumulators A or B have overflowed
- bit 10 **SAB:** SA || SB Combined Accumulator 'Sticky' Status bit⁽¹⁾
 1 = Accumulators A or B are saturated or have been saturated at some time
 0 = Neither Accumulators A or B are saturated
- bit 9 **DA:** DO Loop Active bit⁽¹⁾
 1 = DO loop is in progress
 0 = DO loop is not in progress
- bit 8 **DC:** MCU ALU Half Carry/Borrow bit
 1 = A carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred
 0 = No carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred

- Note 1:** This bit is available on dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices only.
- Note 2:** The IPL[2:0] bits are concatenated with the IPL[3] bit (CORCON[3]) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL[3] = 1. User interrupts are disabled when IPL[3] = 1.
- Note 3:** The IPL[2:0] Status bits are read-only when the NSTDIS bit (INTCON1[15]) = 1.
- Note 4:** A data write to the SR register can modify the SA and SB bits by either a data write to SA and SB or by clearing the SAB bit. To avoid a possible SA or SB bit write race condition, the SA and SB bits should not be modified using bit operations.

REGISTER 3-1: SR: CPU STATUS REGISTER (CONTINUED)

| | |
|---------|--|
| bit 7-5 | IPL[2:0]: CPU Interrupt Priority Level Status bits ^(2,3) 111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled 110 = CPU Interrupt Priority Level is 6 (14) 101 = CPU Interrupt Priority Level is 5 (13) 100 = CPU Interrupt Priority Level is 4 (12) 011 = CPU Interrupt Priority Level is 3 (11) 010 = CPU Interrupt Priority Level is 2 (10) 001 = CPU Interrupt Priority Level is 1 (9) 000 = CPU Interrupt Priority Level is 0 (8) |

| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

- bit 15 **VAR:** Variable Exception Processing Latency Control bit
 1 = Variable exception processing latency is enabled
 0 = Fixed exception processing latency is enabled
- bit 14 **Unimplemented:** Read as '0'
- bit 13-12 **US[1:0]:** DSP Multiply Unsigned/Signed Control bits⁽¹⁾
 11 = Reserved
 10 = DSP engine multiplies are mixed-sign
 01 = DSP engine multiplies are unsigned
 00 = DSP engine multiplies are signed
- bit 11 **EDT:** Early DO Loop Termination Control bit^(1,2)
 1 = Terminates executing DO loop at end of current loop iteration
 0 = No effect
- bit 10-8 **DL[2:0]:** DO Loop Nesting Level Status bits⁽¹⁾
 111 = Seven DO loops are active
 •
 •
 •
 001 = One DO loop is active
 000 = Zero DO loops are active
- bit 7 **SATA:** ACCA Saturation Enable bit⁽¹⁾
 1 = Accumulator A saturation is enabled
 0 = Accumulator A saturation is disabled
- bit 6 **SATB:** ACCB Saturation Enable bit⁽¹⁾
 1 = Accumulator B saturation is enabled
 0 = Accumulator B saturation is disabled
- bit 5 **SATDW:** Data Space Write from DSP Engine Saturation Enable bit⁽¹⁾
 1 = Data Space write saturation is enabled
 0 = Data Space write saturation is disabled
- bit 4 **ACCSAT:** Accumulator Saturation Mode Select bit⁽¹⁾
 1 = 9.31 saturation (super saturation)
 0 = 1.31 saturation (normal saturation)
- bit 3 **IPL3:** CPU Interrupt Priority Level Status bit 3⁽³⁾
 1 = CPU Interrupt Priority Level is greater than 7
 0 = CPU Interrupt Priority Level is 7 or less

- Note 1:** This bit is available on dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices only.
Note 2: This bit is always read as '0'.
Note 3: The IPL3 bit is concatenated with the IPL[2:0] bits (SR[7:5]) to form the CPU Interrupt Priority Level.

REGISTER 3-2: CORCON: CORE CONTROL REGISTER (CONTINUED)

- bit 2 **SFA:** Stack Frame Active Status bit
1 = Stack frame is active; W14 and W15 address 0x0000 to 0xFFFF, regardless of DSRPAG and DSWPAG values
0 = Stack frame is not active; W14 and W15 address of EDS or Base Data Space
- bit 1 **RND:** Rounding Mode Select bit⁽¹⁾
1 = Biased (conventional) rounding is enabled
0 = Unbiased (convergent) rounding is enabled
- bit 0 **IF:** Integer or Fractional Multiplier Mode Select bit⁽¹⁾
1 = Integer mode is enabled for DSP multiply
0 = Fractional mode is enabled for DSP multiply

- Note 1:** This bit is available on dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices only.
2: This bit is always read as '0'.
3: The IPL3 bit is concatenated with the IPL[2:0] bits (SR[7:5]) to form the CPU Interrupt Priority Level.

3.8 Arithmetic Logic Unit (ALU)

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X ALU is 16 bits wide, and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

Refer to the “16-Bit MCU and DSC Programmer's Reference Manual” (DS70000157) for information on the SR bits affected by each instruction.

The core CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

3.8.1 MULTIPLIER

Using the high-speed 17-bit x 17-bit multiplier, the ALU supports unsigned, signed, or mixed-sign operation in several MCU multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit signed x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

3.8.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- 32-bit signed/16-bit signed divide
- 32-bit unsigned/16-bit unsigned divide
- 16-bit signed/16-bit signed divide
- 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. The 16-bit signed and unsigned `DIV` instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

3.9 DSP Engine (dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X Devices Only)

The DSP engine consists of a high-speed 17-bit x 17-bit multiplier, a 40-bit barrel shifter and a 40-bit adder/subtractor (with two target accumulators, round and saturation logic).

The DSP engine can also perform inherent accumulator-to-accumulator operations that require no additional data. These instructions are `ADD`, `SUB` and `NEG`.

The DSP engine has options selected through bits in the CPU Core Control register (CORCON), as listed below:

- Fractional or integer DSP multiply (IF)
- Signed, unsigned or mixed-sign DSP multiply (US)
- Conventional or convergent rounding (RND)
- Automatic saturation on/off for ACCA (SATA)
- Automatic saturation on/off for ACCB (SATB)
- Automatic saturation on/off for writes to data memory (SATDW)
- Accumulator Saturation mode selection (ACCSAT)

TABLE 3-2: DSP INSTRUCTIONS SUMMARY

| Instruction | Algebraic Operation | ACC Write Back |
|-------------|-----------------------|----------------|
| CLR | $A = 0$ | Yes |
| ED | $A = (x - y)^2$ | No |
| EDAC | $A = A + (x - y)^2$ | No |
| MAC | $A = A + (x \cdot y)$ | Yes |
| MAC | $A = A + x^2$ | No |
| MOVSAC | No change in A | Yes |
| MPY | $A = x \cdot y$ | No |
| MPY | $A = x^2$ | No |
| MPY, N | $A = -x \cdot y$ | No |
| MSC | $A = A - x \cdot y$ | Yes |

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “dsPIC33/PIC24 Program Memory” (www.microchip.com/DS70000613) in the “dsPIC33/PIC24 Family Reference Manual”.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X architecture features separate program and data memory spaces, and buses. This architecture also allows the direct access of program memory from the Data Space (DS) during code execution.

4.1 Program Address Space

The program address memory space of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit PC during program execution, or from table operation or Data Space remapping, as described in [Section 4.8 “Interfacing Program and Data Memory Spaces”](#).

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFFFF). The exception is the use of TBLRD operations, which use TBLPAG[7] to read Device ID sections of the configuration memory space.

The program memory maps, which are presented by device family and memory size, are shown in [Figure 4-1](#) through [Figure 4-5](#).

FIGURE 4-1: PROGRAM MEMORY MAP FOR dsPIC33EP32GP50X, dsPIC33EP32MC20X/50X AND PIC24EP32GP/MC20X DEVICES

FIGURE 4-4: PROGRAM MEMORY MAP FOR dsPIC33EP256GP50X, dsPIC33EP256MC20X/50X AND PIC24EP256GP/MC20X DEVICES

Note: Memory areas are not shown to scale.

FIGURE 4-5: PROGRAM MEMORY MAP FOR dsPIC33EP512GP50X, dsPIC33EP512MC20X/50X AND PIC24EP512GP/MC20X DEVICES

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 4-6).

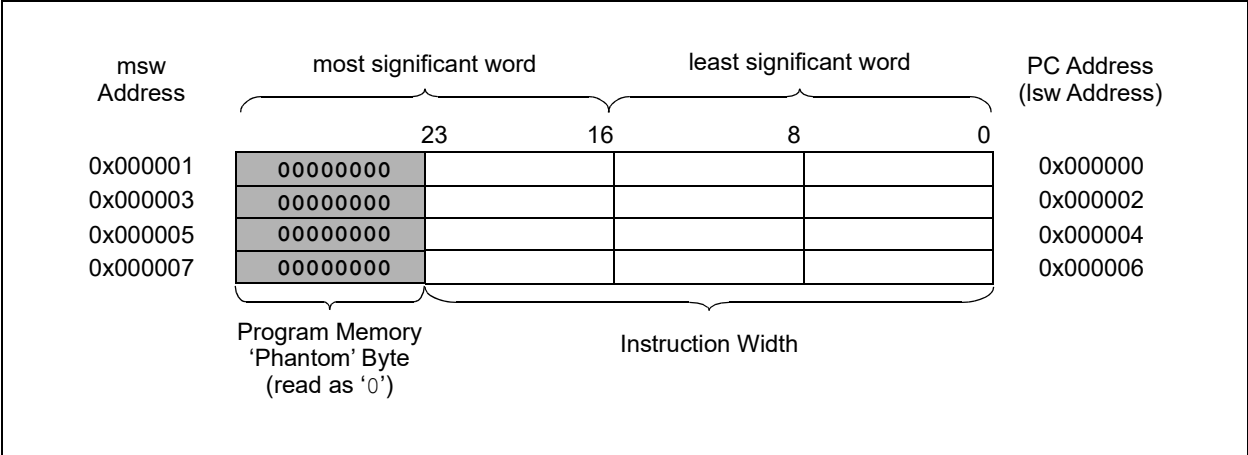

Program memory addresses are always word-aligned on the lower word and addresses are incremented, or decremented by two, during code execution. This arrangement provides compatibility with data memory space addressing and makes data in the program memory space accessible.

4.1.2 INTERRUPT AND TRAP VECTORS

All dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices reserve the addresses between 0x000000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user application at address, 0x000000, of Flash memory, with the actual address for the start of code at address, 0x000002, of Flash memory.

A more detailed discussion of the Interrupt Vector Tables (IVTs) is provided in Section 7.1 “Interrupt Vector Table”.

FIGURE 4-6: PROGRAM MEMORY ORGANIZATION

4.2 Data Address Space

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X CPU has a separate 16-bit wide data memory space. The Data Space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory maps, which are presented by device family and memory size, are shown in Figure 4-7 through Figure 4-16.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the Data Space. This arrangement gives a base Data Space address range of 64 Kbytes (32K words).

The base Data Space address is used in conjunction with a Read or Write Page register (DSRPAG or DSWPAG) to form an Extended Data Space, which has a total address range of 16 Mbytes.

dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices implement up to 52 Kbytes of data memory (4 Kbytes of data memory for Special Function Registers and up to 48 Kbytes of data memory for RAM). If an EA points to a location outside of this area, an all-zero word or byte is returned.

4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte-addressable, 16-bit wide blocks. Data are aligned in data memory and registers as 16-bit words, but all Data Space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC® MCU devices and improve Data Space memory usage efficiency, the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] results in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

A data byte read, reads the complete word that contains the byte, using the LSB of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel, byte-wide entities with shared (word) address decode but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the LSB. The MSB is not modified.

A Sign-Extend (SE) instruction is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

4.2.3 SFR SPACE

The first 4 Kbytes of the Near Data Space, from 0x0000 to 0x0FFF, is primarily occupied by Special Function Registers (SFRs). These are used by the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'.

Note: The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information.

4.2.4 NEAR DATA SPACE

The 8-Kbyte area, between 0x0000 and 0x1FFF, is referred to as the Near Data Space. Locations in this space are directly addressable through a 13-bit absolute address field within all memory direct instructions. Additionally, the whole Data Space is addressable using MOV instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a Working register as an Address Pointer.

4.2.5 X AND Y DATA SPACES

The dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X core has two Data Spaces, X and Y. These Data Spaces can be considered either separate (for some DSP instructions) or as one unified linear address range (for MCU instructions). The Data Spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms, such as Finite Impulse Response (FIR) filtering and Fast Fourier Transform (FFT).

The X Data Space is used by all instructions and supports all addressing modes. X Data Space has separate read and write data buses. The X read data bus is the read data path for all instructions that view Data Space as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y Data Space is used in concert with the X Data Space by the MAC class of instructions (CLR, ED, EDAC, MAC, MOVSAC, MPY, MPY.N and MSC) to provide two concurrent data read paths.

Both the X and Y Data Spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to X Data Space. Modulo Addressing and Bit-Reversed Addressing are not present in PIC24EPXXXGP/MC20X devices.

All data memory writes, including in DSP instructions, view Data Space as combined X and Y address space. The boundary between the X and Y Data Spaces is device-dependent and is not user-programmable.

4.3 Memory Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

4.4.1 PAGED MEMORY SCHEME

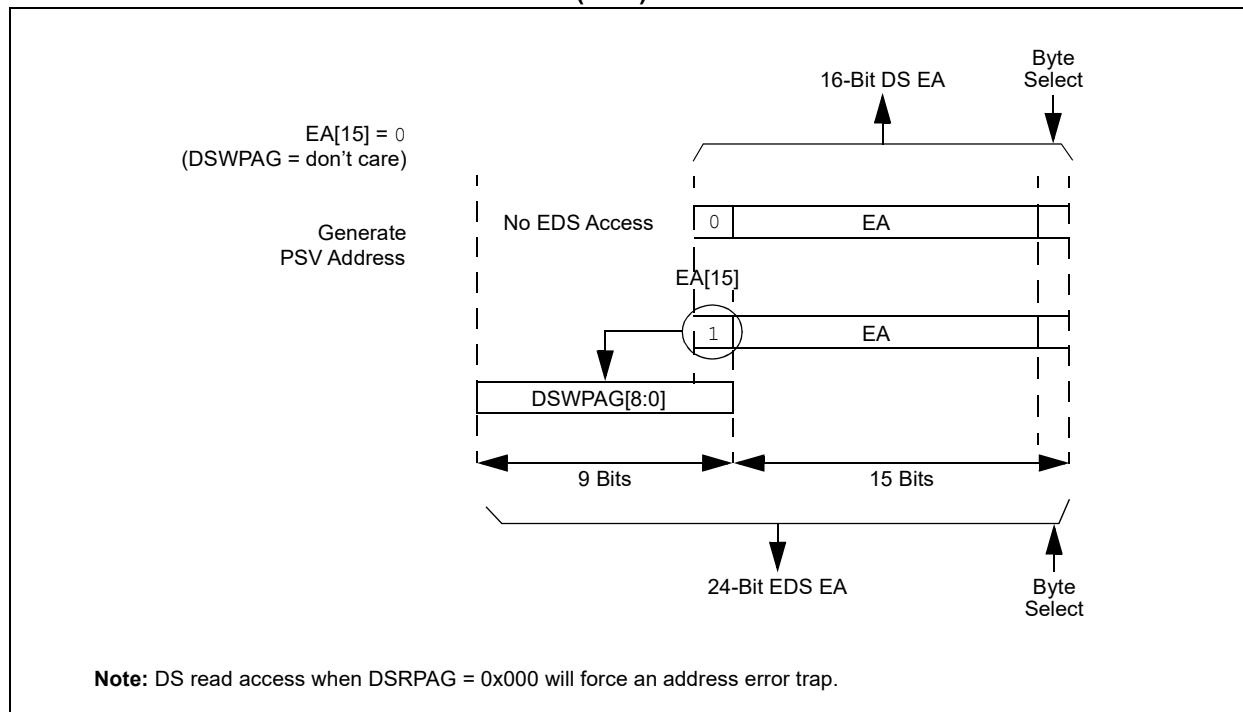

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X architecture extends the available Data Space through a paging scheme, which allows the available Data Space to be accessed using MOV instructions in a linear fashion for pre-modified and post-modified Effective Addresses (EA). The upper half of the base Data Space address is used in conjunction with the Data Space Page registers, the 10-bit Read Page register (DSRPAG) or the 9-bit Write Page register (DSWPAG), to form an

Extended Data Space (EDS) address or Program Space Visibility (PSV) address. The Data Space Page registers are located in the SFR space.

Construction of the EDS address is shown in [Example 4-1](#). When DSRPAG[9] = 0 and the base address bit, EA[15] = 1, the DSRPAG[8:0] bits are concatenated onto EA[14:0] to form the 24-bit EDS read address. Similarly, when base address bit, EA[15] = 1, DSWPAG[8:0] are concatenated onto EA[14:0] to form the 24-bit EDS write address.

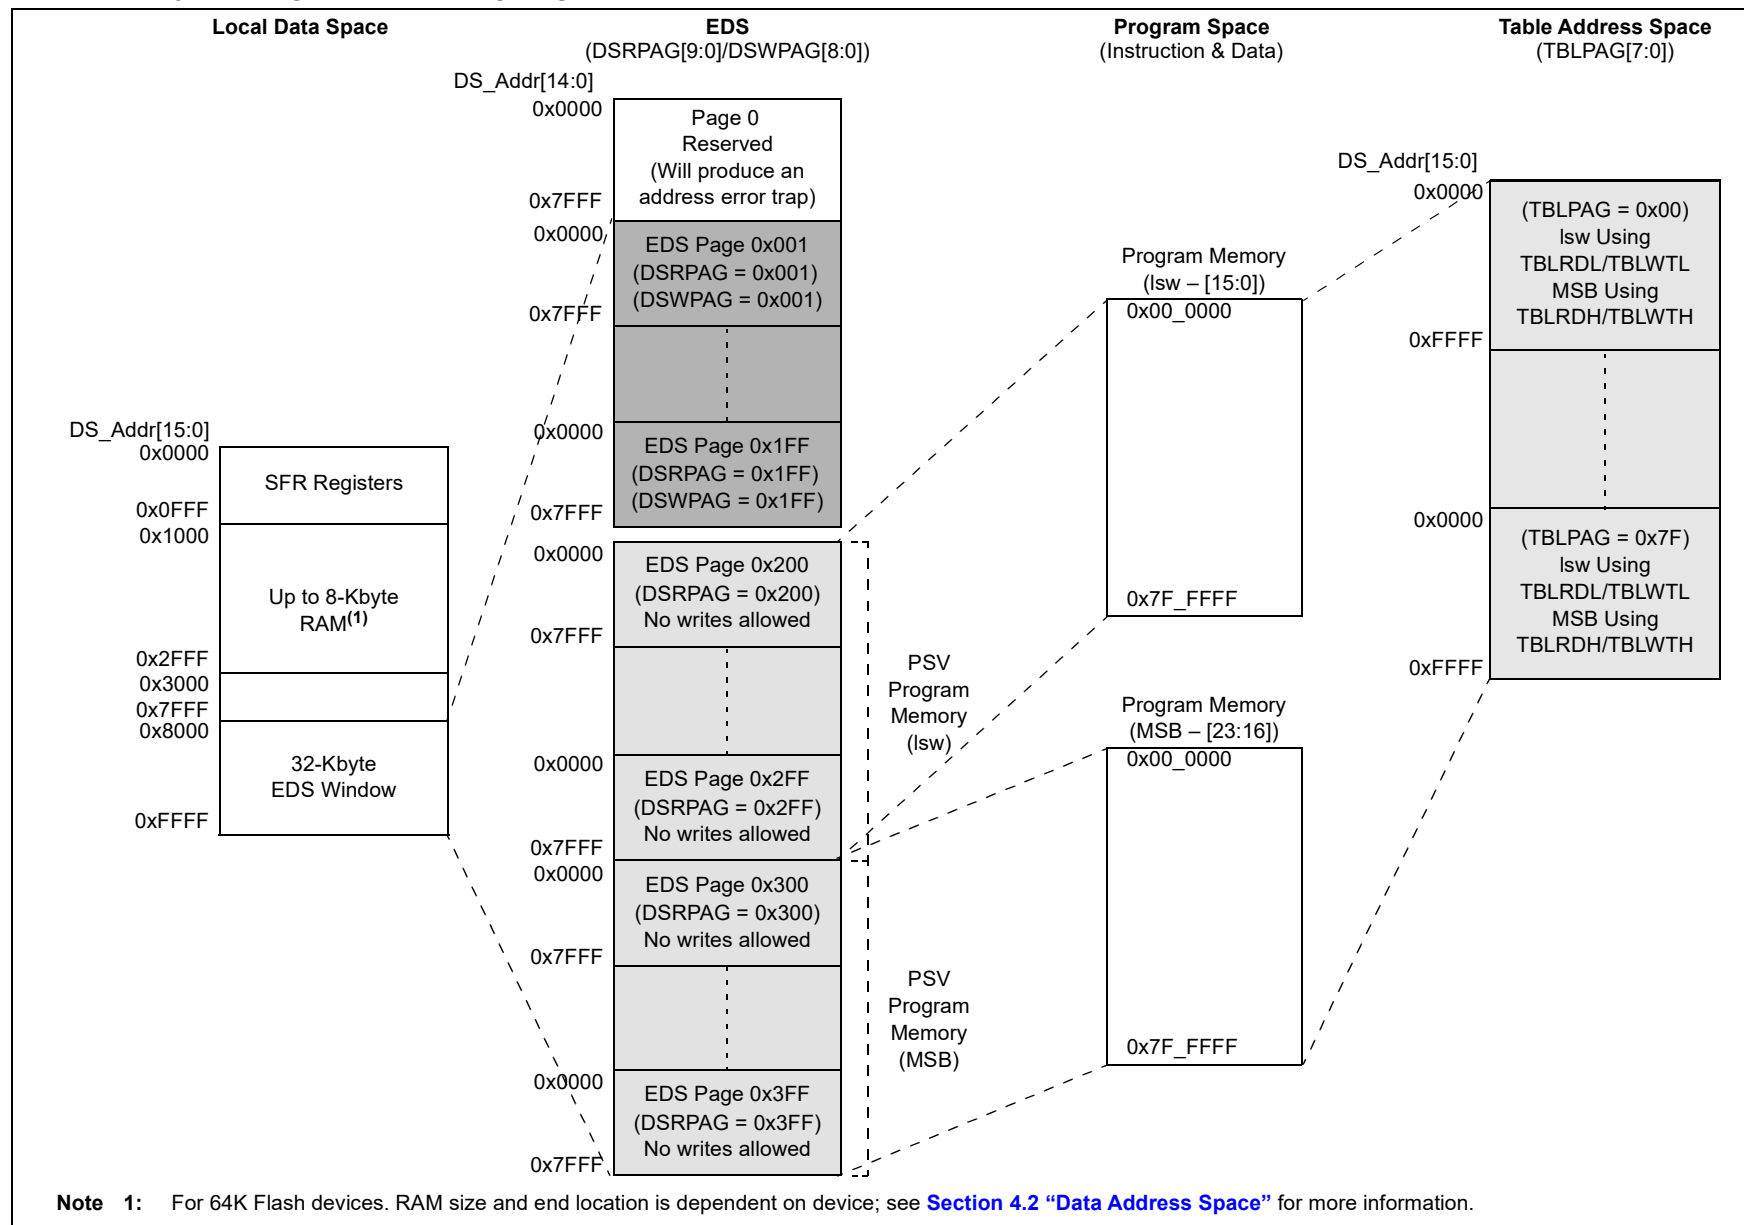

EXAMPLE 4-1: EXTENDED DATA SPACE (EDS) READ ADDRESS GENERATION

EXAMPLE 4-2: EXTENDED DATA SPACE (EDS) WRITE ADDRESS GENERATION

The paged memory scheme provides access to multiple 32-Kbyte windows in the EDS and PSV memory. The Data Space Page registers, DSxPAG, in combination with the upper half of the Data Space address, can provide up to 16 Mbytes of additional address space in the EDS and 8 Mbytes (DSRPAG only) of PSV address space. The paged data memory space is shown in [Example 4-3](#).

The Program Space (PS) can be accessed with a DSRPAG of 0x200 or greater. Only reads from PS are supported using the DSRPAG. Writes to PS are not supported, so DSWPAG is dedicated to DS, including EDS only. The Data Space and EDS can be read from, and written to, using DSRPAG and DSWPAG, respectively.

EXAMPLE 4-3: PAGED DATA MEMORY SPACE

Allocating different Page registers for read and write access allows the architecture to support data movement between different pages in data memory. This is accomplished by setting the DSRPAG register value to the page from which you want to read, and configuring the DSWPAG register to the page to which it needs to be written. Data can also be moved from different PSV to EDS pages, by configuring the DSRPAG and DSWPAG registers to address PSV and EDS space, respectively. The data can be moved between pages by a single instruction.

When an EDS or PSV page overflow or underflow occurs, EA[15] is cleared as a result of the register indirect EA calculation. An overflow or underflow of the EA in the EDS or PSV pages can occur at the page boundaries when:

- The initial address prior to modification addresses an EDS or PSV page
- The EA calculation uses Pre-Modified or Post-Modified Register Indirect Addressing; however, this does not include Register Offset Addressing

In general, when an overflow is detected, the DSxPAG register is incremented and the EA[15] bit is set to keep the base address within the EDS or PSV window. When an underflow is detected, the DSxPAG register is decremented and the EA[15] bit is set to keep the base address within the EDS or PSV window. This creates a linear EDS and PSV address space, but only when using Register Indirect Addressing modes.

Exceptions to the operation described above arise when entering and exiting the boundaries of Page 0, EDS and PSV spaces. [Table 4-61](#) lists the effects of overflow and underflow scenarios at different boundaries.

In the following cases, when overflow or underflow occurs, the EA[15] bit is set and the DSxPAG is not modified; therefore, the EA will wrap to the beginning of the current page:

- Register Indirect with Register Offset Addressing
- Modulo Addressing
- Bit-Reversed Addressing

TABLE 4-61: OVERFLOW AND UNDERFLOW SCENARIOS AT PAGE 0, EDS and PSV SPACE BOUNDARIES^(2,3,4)

| O/U, R/W | Operation | Before | | | After | | |
|-------------|------------------------|----------------|--------------|---------------------|----------------|--------------|----------------------------|
| | | DSxPAG | DS EA[15] | Page Description | DSxPAG | DS EA[15] | Page Description |
| O, Read | [++Wn] or [Wn++] | DSRPAG = 0x1FF | 1 | EDS: Last page | DSRPAG = 0x1FF | 0 | See Note 1 |
| O, Read | | DSRPAG = 0x2FF | 1 | PSV: Last lsw page | DSRPAG = 0x300 | 1 | PSV: First MSB page |
| O, Read | | DSRPAG = 0x3FF | 1 | PSV: Last MSB page | DSRPAG = 0x3FF | 0 | See Note 1 |
| O, Write | | DSWPAG = 0x1FF | 1 | EDS: Last page | DSWPAG = 0x1FF | 0 | See Note 1 |
| U, Read | [--Wn] or [Wn--] | DSRPAG = 0x001 | 1 | PSV page | DSRPAG = 0x001 | 0 | See Note 1 |
| U, Read | | DSRPAG = 0x200 | 1 | PSV: First lsw page | DSRPAG = 0x200 | 0 | See Note 1 |
| U, Read | | DSRPAG = 0x300 | 1 | PSV: First MSB page | DSRPAG = 0x2FF | 1 | PSV: Last lsw page |

Legend: O = Overflow, U = Underflow, R = Read, W = Write

Note 1: The Register Indirect Addressing now addresses a location in the base Data Space (0x0000-0x8000).

2: An EDS access with DSxPAG = 0x000 will generate an address error trap.

3: Only reads from PS are supported using DSRPAG. An attempt to write to PS using DSWPAG will generate an address error trap.

4: Pseudolinear Addressing is not supported for large offsets.

4.4.2 EXTENDED X DATA SPACE

The lower portion of the base address space range, between 0x0000 and 0x7FFF, is always accessible regardless of the contents of the Data Space Page registers. It is indirectly addressable through the register indirect instructions. It can be regarded as being located in the default EDS Page 0 (i.e., EDS address range of 0x000000 to 0x007FFF with the base address bit, EA[15] = 0, for this address range). However, Page 0 cannot be accessed through the upper 32 Kbytes, 0x8000 to 0xFFFF, of base Data Space, in combination with DSRPAG = 0x000 or DSWPAG = 0x000. Consequently, DSRPAG and DSWPAG are initialized to 0x001 at Reset.

Note 1: DSxPAG should not be used to access Page 0. An EDS access with DSxPAG set to 0x000 will generate an address error trap.

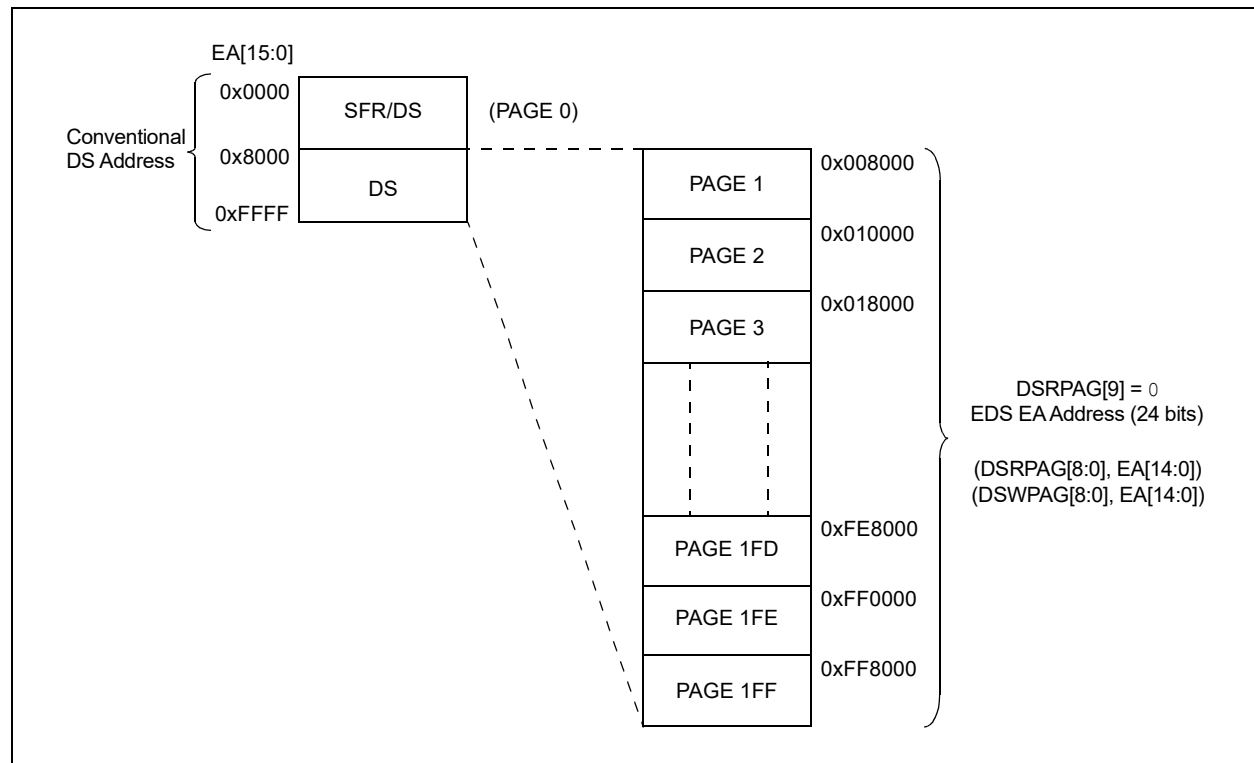

2: Clearing the DSxPAG in software has no effect.

The remaining pages, including both EDS and PSV pages, are only accessible using the DSRPAG or DSWPAG registers in combination with the upper 32 Kbytes, 0x8000 to 0xFFFF, of the base address, where base address bit, EA[15] = 1.

For example, when DSRPAG = 0x001 or DSWPAG = 0x001, accesses to the upper 32 Kbytes, 0x8000 to 0xFFFF, of the Data Space will map to the EDS address range of 0x008000 to 0x00FFFF. When DSRPAG = 0x002 or DSWPAG = 0x002, accesses to the upper 32 Kbytes of the Data Space will map to the EDS address range of 0x010000 to 0x017FFF and so on, as shown in the EDS memory map in Figure 4-17.

For more information on the PSV page access using Data Space Page registers, refer to the “Program Space Visibility from Data Space” section in “dsPIC33/PIC24 Program Memory” (www.microchip.com/DS70000613) of the “dsPIC33/PIC24 Family Reference Manual”.

FIGURE 4-17: EDS MEMORY MAP

4.4.3 DATA MEMORY ARBITRATION AND BUS MASTER PRIORITY

EDS accesses from bus masters in the system are arbitrated.

The arbiter for data memory (including EDS) arbitrates between the CPU, the DMA and the ICD module. In the event of coincidental access to a bus by the bus masters, the arbiter determines which bus master access has the highest priority. The other bus masters are suspended and processed after the access of the bus by the bus master with the highest priority.

By default, the CPU is Bus Master 0 (M0) with the highest priority and the ICD is Bus Master 4 (M4) with the lowest priority. The remaining bus master (DMA Controller) is allocated to M3 (M1 and M2 are reserved and cannot be used). The user application may raise or lower the priority of the DMA Controller to be above that of the CPU by setting the appropriate bits in the EDS Bus Master Priority Control (MSTRPR) register. All bus masters with raised priorities will maintain the same priority relationship relative to each other (i.e., M1 being highest and M3 being lowest, with M2 in between). Also, all the bus masters with priorities below

that of the CPU maintain the same priority relationship relative to each other. The priority schemes for bus masters with different MSTRPR values are tabulated in [Table 4-62](#).

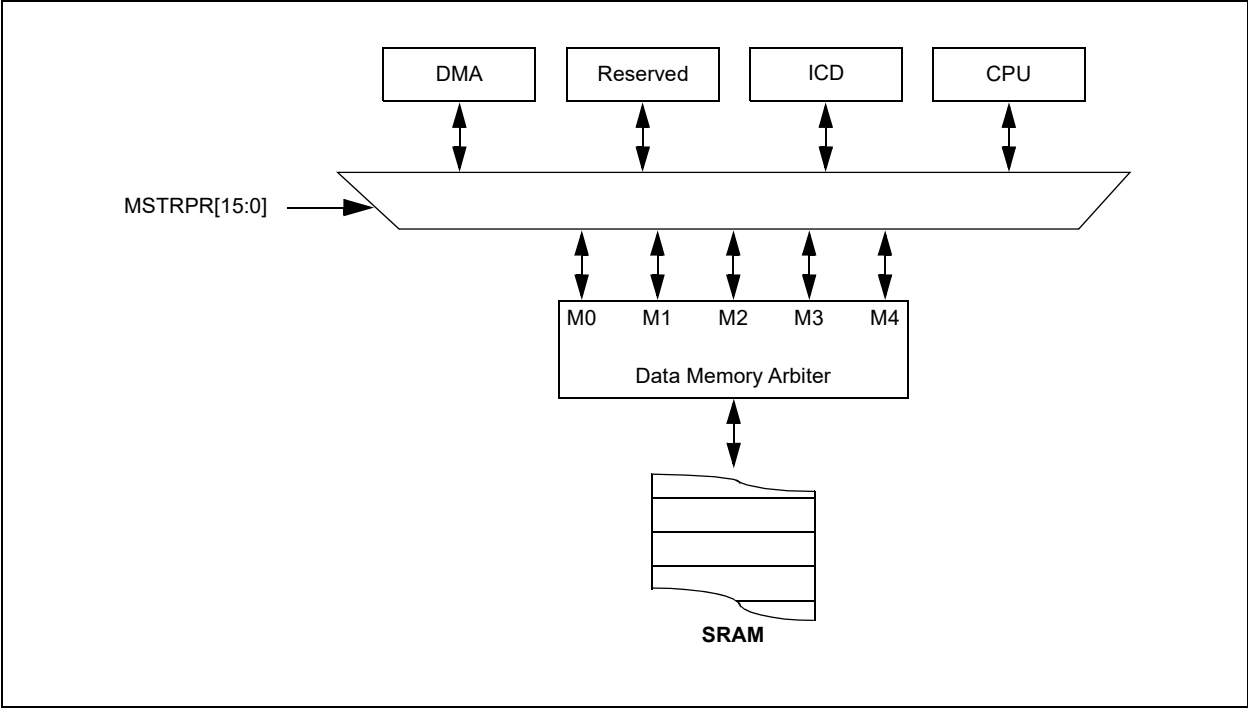

This bus master priority control allows the user application to manipulate the real-time response of the system, either statically during initialization or dynamically in response to real-time events.

TABLE 4-62: DATA MEMORY BUS ARBITER PRIORITY

| Priority | MSTRPR[15:0] Bits Setting ⁽¹⁾ | |
|--------------|--|----------|
| | 0x0000 | 0x0020 |
| M0 (highest) | CPU | DMA |
| M1 | Reserved | CPU |
| M2 | Reserved | Reserved |
| M3 | DMA | Reserved |
| M4 (lowest) | ICD | ICD |

Note 1: All other values of MSTRPR[15:0] are reserved.

FIGURE 4-18: ARBITER ARCHITECTURE

4.4.4 SOFTWARE STACK

The W15 register serves as a dedicated Software Stack Pointer (SSP) and is automatically modified by exception processing, subroutine calls and returns; however, W15 can be referenced by any instruction in the same manner as all other W registers. This simplifies reading, writing and manipulating of the Stack Pointer (for example, creating stack frames).

Note: To protect against misaligned stack accesses, W15[0] is fixed to '0' by the hardware.

W15 is initialized to 0x1000 during all Resets. This address ensures that the SSP points to valid RAM in all dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices, and permits stack availability for non-maskable trap exceptions. These can occur before the SSP is initialized by the user software. You can reprogram the SSP during initialization to any location within Data Space.

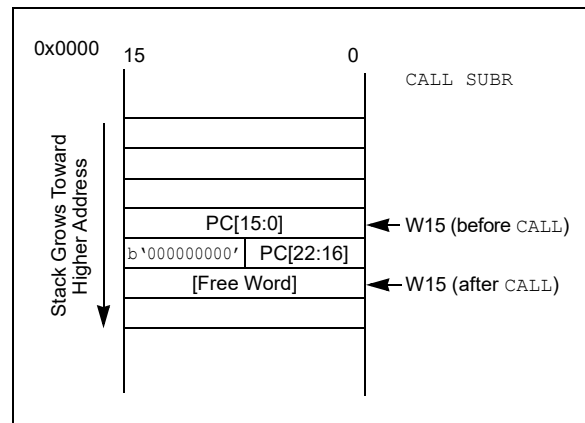

The Software Stack Pointer always points to the first available free word and fills the software stack working from lower toward higher addresses. [Figure 4-19](#) illustrates how it pre-decrements for a stack pop (read) and post-increments for a stack push (writes).

When the PC is pushed onto the stack, PC[15:0] are pushed onto the first available stack word, then PC[22:16] are pushed into the second available stack location. For a PC push during any `CALL` instruction, the MSB of the PC is zero-extended before the push, as shown in [Figure 4-19](#). During exception processing, the MSB of the PC is concatenated with the lower 8 bits of the CPU STATUS Register, SR. This allows the contents of SRL to be preserved automatically during interrupt processing.

Note 1: To maintain system Stack Pointer (W15) coherency, W15 is never subject to (EDS) paging, and is therefore restricted to an address range of 0x0000 to 0xFFFF. The same applies to the W14 when used as a Stack Frame Pointer (SFA = 1).

2: As the stack can be placed in, and can access X and Y spaces, care must be taken regarding its use, particularly with regard to local automatic variables in a C development environment

FIGURE 4-19: CALL STACK FRAME

4.5 Instruction Addressing Modes

The addressing modes shown in Table 4-63 form the basis of the addressing modes optimized to support the specific features of individual instructions. The addressing modes provided in the MAC class of instructions differ from those in the other instruction types.

4.5.1 FILE REGISTER INSTRUCTIONS

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (Near Data Space). Most file register instructions employ a Working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the MUL instruction), which writes the result to a register or register pair. The MOV instruction allows additional flexibility and can access the entire Data Space.

4.5.2 MCU INSTRUCTIONS

The three-operand MCU instructions are of the form:

Operand 3 = Operand 1 [function] Operand 2

where Operand 1 is always a Working register (that is, the addressing mode can only be Register Direct), which is referred to as Wb. Operand 2 can be a W register fetched from data memory or a 5-bit literal. The result location can either be a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-Bit or 10-Bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

TABLE 4-63: FUNDAMENTAL ADDRESSING MODES SUPPORTED

| Addressing Mode | Description |
|---|---|
| File Register Direct | The address of the file register is specified explicitly. |
| Register Direct | The contents of a register are accessed directly. |
| Register Indirect | The contents of Wn form the Effective Address (EA). |
| Register Indirect Post-Modified | The contents of Wn form the EA. Wn is post-modified (incremented or decremented) by a constant value. |
| Register Indirect Pre-Modified | Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA. |
| Register Indirect with Register Offset (Register Indexed) | The sum of Wn and Wb forms the EA. |
| Register Indirect with Literal Offset | The sum of Wn and a literal forms the EA. |

4.5.3 MOVE AND ACCUMULATOR INSTRUCTIONS

Move instructions, which apply to dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices, and the DSP accumulator class of instructions, which apply to the dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X devices, provide a greater degree of addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the `MOV` instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit `Wb` (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-modified
- Register Indirect Pre-modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-Bit Literal
- 16-Bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

4.5.4 MAC INSTRUCTIONS (dsPIC33EPXXXMC20X/50X AND dsPIC33EPXXXGP50X DEVICES ONLY)

The dual source operand DSP instructions (`CLR`, `ED`, `EDAC`, `MAC`, `MPY`, `MPY.N`, `MOVSAC` and `MSC`), also referred to as `MAC` instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through register indirect tables.

The Two-Source Operand Prefetch registers must be members of the set: {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must therefore, be valid addresses within X Data Space for W8 and W9, and Y Data Space for W10 and W11.

Note: Register Indirect with Register Offset Addressing mode is available only for W9 (in X space) and W11 (in Y space).

In summary, the following addressing modes are supported by the `MAC` class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

4.5.5 OTHER INSTRUCTIONS

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, `BRA` (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the `DISI` instruction uses a 14-bit unsigned literal field. In some instructions, such as `ULNK`, the source of an operand or result is implied by the opcode itself. Certain operations, such as a `NOF`, do not have any operands.

4.6 Modulo Addressing (dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X Devices Only)

Modulo Addressing mode is a method of providing an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either Data or Program Space (since the Data Pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into Program Space) and Y Data Spaces. Modulo Addressing can operate on any W Register Pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing since these two registers are used as the Stack Frame Pointer and Stack Pointer, respectively.

Note: Modulo Addressing has address alignment restrictions for the buffer start or end address. See the “Data Memory” FRM (www.microchip.com/DS70595) for more information.

4.6.1 START AND END ADDRESS

The Modulo Addressing scheme requires that a starting and ending address be specified, and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT and YMODEND (see Table 4-1).

Note: Y space Modulo Addressing EA calculations assume word-sized data (LSb of every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

4.6.2 W ADDRESS REGISTER SELECTION

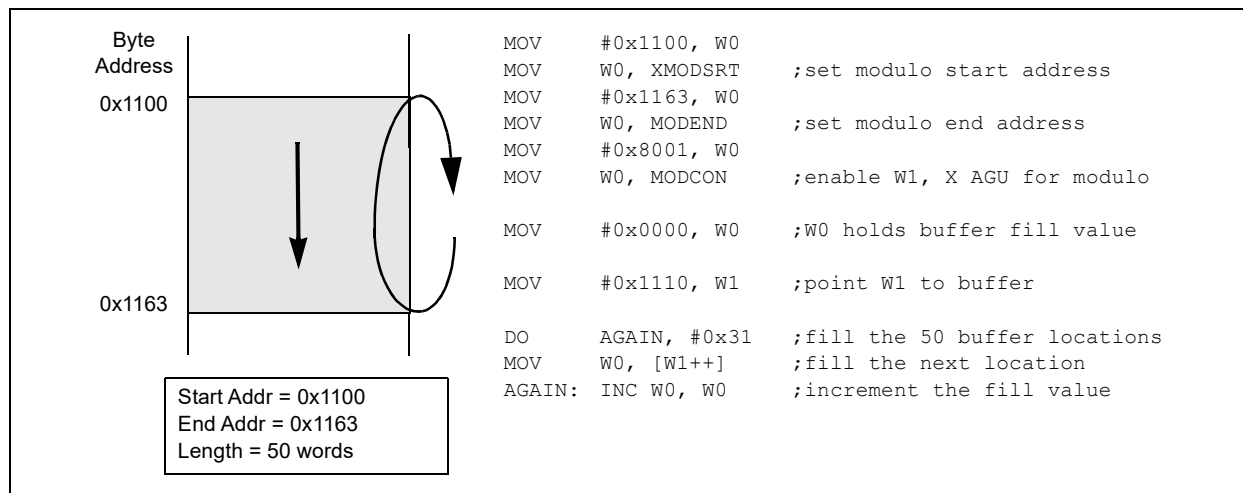

The Modulo and Bit-Reversed Addressing Control register, MODCON[15:0], contains enable flags as well as a W register field to specify the W Address registers. The XWM and YWM fields select the registers that operate with Modulo Addressing:

- If XWM = 1111, X RAGU and X WAGU Modulo Addressing is disabled
- If YWM = 1111, Y AGU Modulo Addressing is disabled

The X Address Space Pointer W register (XWM), to which Modulo Addressing is to be applied, is stored in MODCON[3:0] (see Table 4-1). Modulo Addressing is enabled for X Data Space when XWM is set to any value other than ‘1111’ and the XMODEN bit is set (MODCON[15]).

The Y Address Space Pointer W register (YWM), to which Modulo Addressing is to be applied, is stored in MODCON[7:4]. Modulo Addressing is enabled for Y Data Space when YWM is set to any value other than ‘1111’ and the YMODEN bit is set at MODCON[14].

FIGURE 4-20: MODULO ADDRESSING OPERATION EXAMPLE

Note: Modulo Addressing has address alignment restrictions for the buffer start or end address. See the “Data Memory” FRM (www.microchip.com/DS70595) for more information.

Note: The modulo corrected Effective Address is written back to the register only when Pre-Modify or Post-Modify Addressing mode is used to compute the Effective Address. When an address offset (such as $[W7 + W2]$) is used, Modulo Addressing correction is performed but the contents of the register remain unchanged.

If the length of a bit-reversed buffer is $M = 2^N$ bytes, the last ‘N’ bits of the data buffer start address must be zeros.

XBREV[14:0] is the Bit-Reversed Addressing modifier, or ‘pivot point’, which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

Note: All bit-reversed EA calculations assume word-sized data (LSb of every EA is always clear). The XBREVx value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word-sized data writes. It does not function for any other addressing mode or for byte-sized data and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always added to the address modifier (XBREVx) and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word-sized data are a requirement, the LSb of the EA is ignored (and always clear).

Note: Modulo Addressing and Bit-Reversed Addressing can be enabled simultaneously using the same W register, but Bit-Reversed Addressing operation will always take precedence for data writes when enabled.

4.7 Bit-Reversed Addressing (dsPIC33EPXXXMC20X/50X and dsPIC33EPXXXGP50X Devices Only)

Bit-Reversed Addressing mode is intended to simplify data reordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

4.7.1 BIT-REVERSED ADDRESSING IMPLEMENTATION

Bit-Reversed Addressing mode is enabled when all these conditions are met:

- BWMx bits (W register selection) in the MODCON register are any value other than ‘1111’ (the stack cannot be accessed using Bit-Reversed Addressing)
- The BREN bit is set in the XBREV register
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment

If Bit-Reversed Addressing has already been enabled by setting the BREN (XBREV[15]) bit, a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the Bit-Reversed Pointer.

FIGURE 4-21: BIT-REVERSED ADDRESSING EXAMPLE

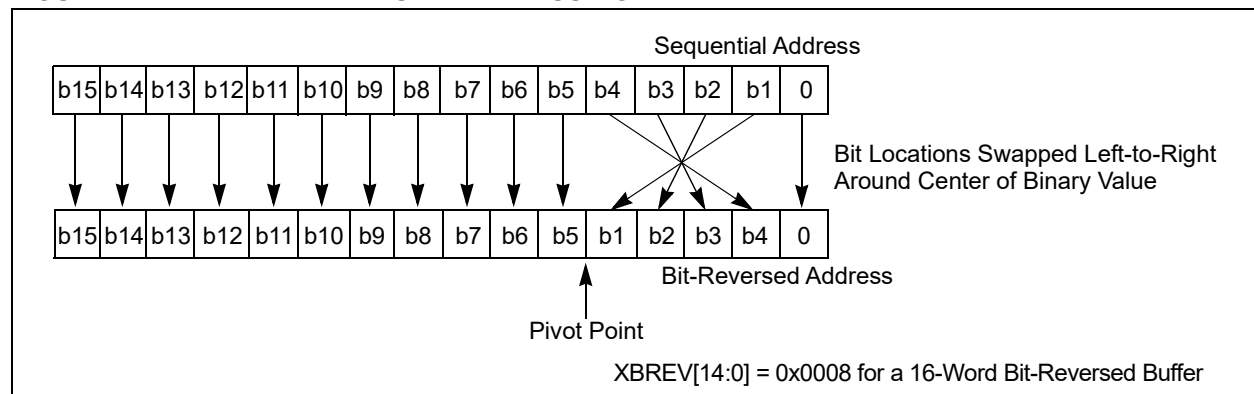

TABLE 4-64: BIT-REVERSED ADDRESSING SEQUENCE (16-ENTRY)

| Normal Address | | | | | Bit-Reversed Address | | | | |
|----------------|----|----|----|---------|----------------------|----|----|----|---------|
| A3 | A2 | A1 | A0 | Decimal | A3 | A2 | A1 | A0 | Decimal |

4.8 Interfacing Program and Data Memory Spaces

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X architecture uses a 24-bit wide Program Space (PS) and a 16-bit wide Data Space (DS). The architecture is also a modified Harvard scheme, meaning that data can also be present in the Program Space. To use these data successfully, they must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the architecture of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices provides two methods by which Program Space can be accessed during operation:

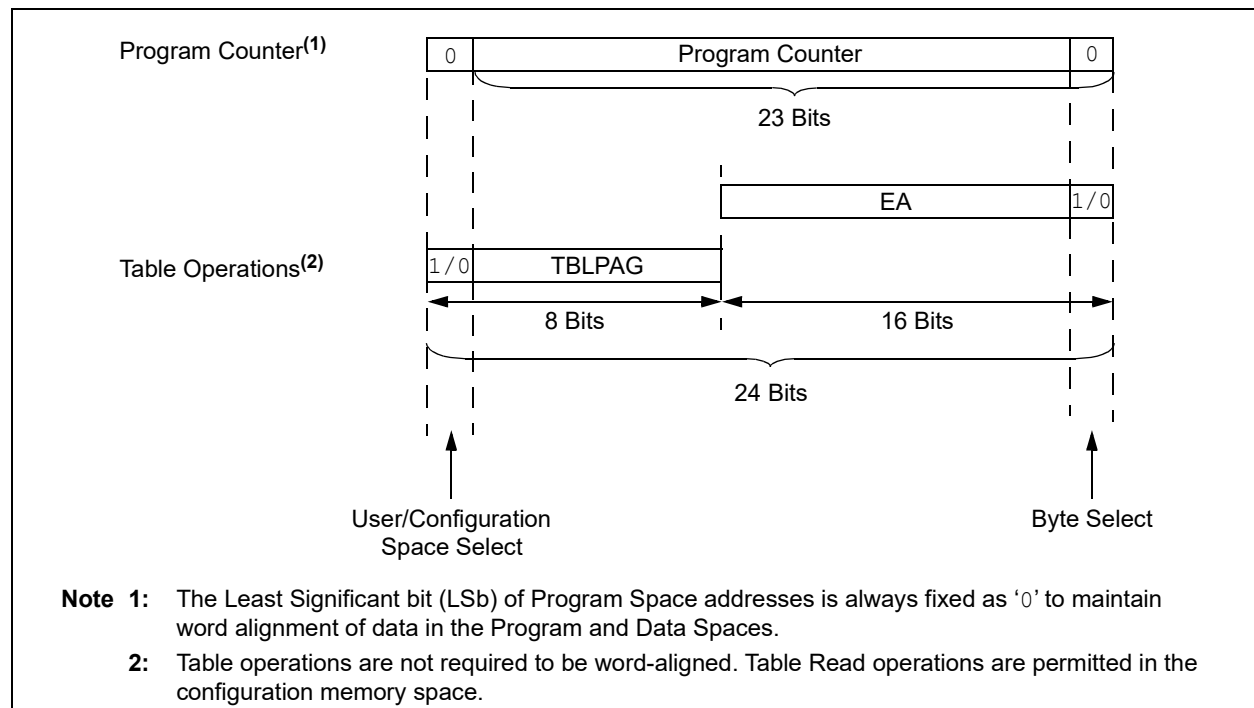

- Using table instructions to access individual bytes or words anywhere in the Program Space
- Remapping a portion of the Program Space into the Data Space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. The application can only access the least significant word of the program word.

TABLE 4-65: PROGRAM SPACE ADDRESS CONSTRUCTION

| Access Type | Access Space | Program Space Address | | | | |
|--|---------------|---|----------|------------------------------|--------|-----|
| | | [23] | [22:16] | [15] | [14:1] | [0] |
| Instruction Access (Code Execution) | User | 0 | PC[22:1] | | | 0 |
| | | 0xx xxxx xxxx xxxx xxxx xxx0 | | | | |
| TBLRD/TBLWT (Byte/Word Read/Write) | User | TBLPAG[7:0] | | Data EA[15:0] | | |
| | | 0xxx xxxx | | xxxx xxxx xxxx xxxx | | |
| | Configuration | TBLPAG[7:0] | | Data EA[15:0] | | |
| | | 1xxx xxxx | | xxxx xxxx xxxx xxxx | | |

FIGURE 4-22: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION

4.8.1 DATA ACCESS FROM PROGRAM MEMORY USING TABLE INSTRUCTIONS

The `TBLRDH` and `TBLWTL` instructions offer a direct method of reading or writing the lower word of any address within the Program Space without going through Data Space. The `TBLRDH` and `TBLWTH` instructions are the only method to read or write the upper 8 bits of a Program Space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to Data Space addresses. Program memory can thus be regarded as two 16-bit wide word address spaces, residing side by side, each with the same address range. `TBLRDH` and `TBLWTL` access the space that contains the least significant data word. `TBLRDH` and `TBLWTH` access the space that contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from Program Space. Both function as either byte or word operations.

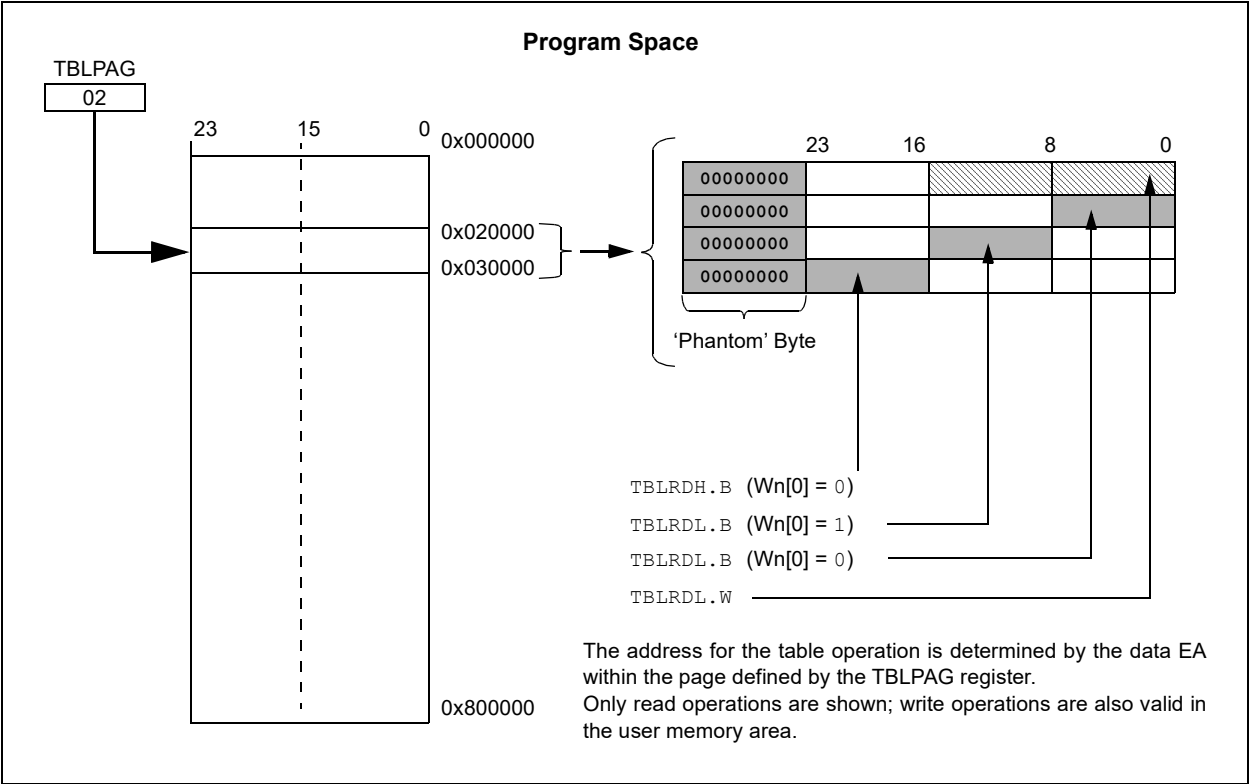

- `TBLRDH` (Table Read High):
 - In Word mode, this instruction maps the lower word of the Program Space location (`P[15:0]`) to a data address (`D[15:0]`)

- In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.
- `TBLRDH` (Table Read High):
 - In Word mode, this instruction maps the entire upper word of a program address (`P[23:16]`) to a data address. The 'phantom' byte (`D[15:8]`) is always '0'.
 - In Byte mode, this instruction maps the upper or lower byte of the program word to `D[7:0]` of the data address in the `TBLRDH` instruction. The data are always '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, `TBLWTH` and `TBLWTL`, are used to write individual bytes or words to a Program Space address. The details of their operation are explained in [Section 5.0 "Flash Program Memory"](#).

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (`TBLPAG`). `TBLPAG` covers the entire program memory space of the device, including user application and configuration spaces. When `TBLPAG[7] = 0`, the table page is located in the user memory space. When `TBLPAG[7] = 1`, the page is located in configuration space.

FIGURE 4-23: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS

5.0 FLASH PROGRAM MEMORY

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Flash Programming” (www.microchip.com/DS70000609) in the “dsPIC33/PIC24 Family Reference Manual”.

- 2:** Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire VDD range.

Flash memory can be programmed in two ways:

- In-Circuit Serial Programming™ (ICSP™) programming capability
- Run-Time Self-Programming (RTSP)

ICSP allows for a dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X device to be serially programmed while in the end application circuit. This is done with two lines for programming clock and programming data (one of the

alternate programming pin pairs: PGECx/PGEDx), and three other lines for power (VDD), ground (VSS) and Master Clear (MCLR). This allows customers to manufacture boards with unprogrammed devices and then program the device just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

RTSP is accomplished using TBLRD (Table Read) and TBLWT (Table Write) instructions. With RTSP, the user application can write program memory data a single program memory word, and erase program memory in blocks or ‘pages’ of 1024 instructions (3072 bytes) at a time.

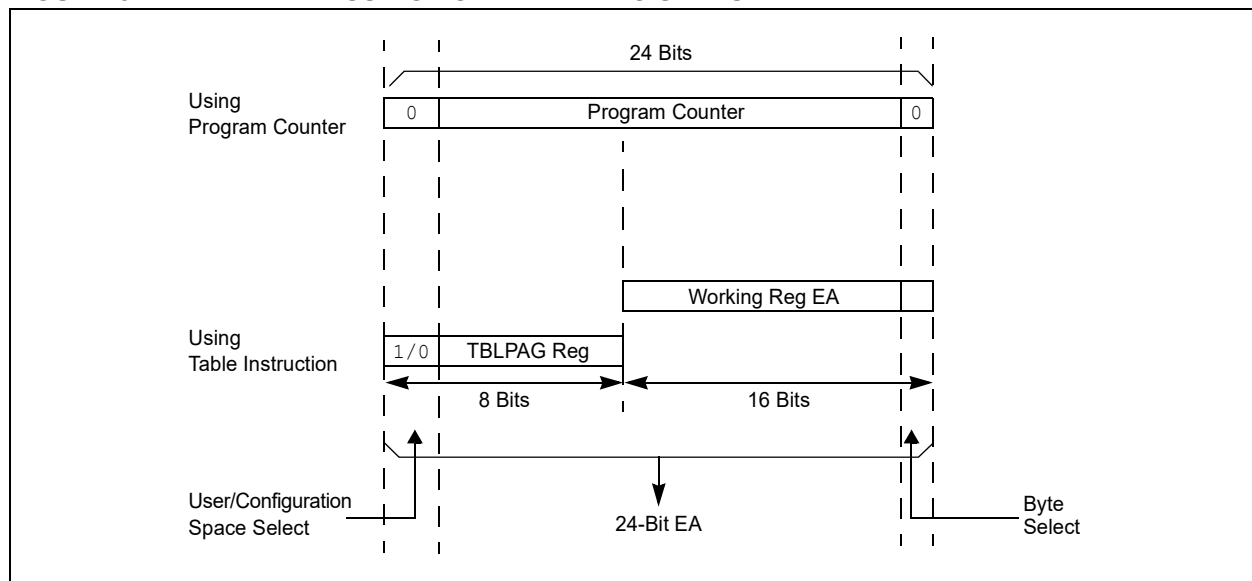

5.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the Table Read and Table Write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits[7:0] of the TBLPAG register and the Effective Address (EA) from a W register, specified in the table instruction, as shown in [Figure 5-1](#).

The TBLRDL and the TBLWTL instructions are used to read or write to bits[15:0] of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits[23:16] of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

FIGURE 5-1: ADDRESSING FOR TABLE REGISTERS

5.2 RTSP Operation

RTSP allows the user application to erase a single page of memory and to program two instruction words at a time. See the General Purpose and Motor Control Family tables (Table 1 and Table 2, respectively) for the page sizes of each device.

For more information on erasing and programming Flash memory, refer to “Flash Programming” (www.microchip.com/DS70000609) in the “dsPIC33/PIC24 Family Reference Manual”.

5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished.

For erase and program times, refer to Parameters D137a and D137b (Page Erase Time), and D138a and D138b (Word Write Cycle Time) in Table 30-14 in Section 30.0 “Electrical Characteristics”.

Setting the WR bit (NVMCON[15]) starts the operation and the WR bit is automatically cleared when the operation is finished.

5.3.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

Programmers can program two adjacent words (24 bits x 2) of program Flash memory at a time on every other word address boundary (0x000002, 0x000006, 0x00000A, etc.). To do this, it is necessary to erase the page that contains the desired address of the location the user wants to change.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user application must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPs.

Refer to **Flash Programming** (www.microchip.com/DS70000609) in the “dsPIC33/PIC24 Family Reference Manual” for details and codes examples on programming using RTSP.

5.4 Flash Memory Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464>

5.5 Control Registers

Four SFRs are used to erase and write the program Flash memory: NVMCON, NVMKEY, NVMADRH and NVMADRL.

The NVMCON register (Register 5-1) enables and initiates Flash memory erase and write operations.

NVMKEY (Register 5-4) is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register.

There are two NVM Address registers: NVMADRH and NVMADRL. These two registers, when concatenated, form the 24-bit Effective Address (EA) of the selected word for programming operations or the selected page for erase operations.

The NVMADRH register is used to hold the upper eight bits of the EA, while the NVMADRL register is used to hold the lower 16 bits of the EA.

REGISTER 5-1: NVMCON: NONVOLATILE MEMORY (NVM) CONTROL REGISTER

6.0 RESETS

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Reset” (www.microchip.com/DS70602) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The Reset module combines all Reset sources and controls the device Master Reset Signal, $\overline{\text{SYSRST}}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- BOR: Brown-out Reset
- $\overline{\text{MCLR}}$: Master Clear Pin Reset
- SWR: RESET Instruction
- WDTO: Watchdog Timer Time-out Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
 - Illegal Opcode Reset
 - Uninitialized W Register Reset
 - Security Reset

A simplified block diagram of the Reset module is shown in [Figure 6-1](#).

Any active source of Reset will make the $\overline{\text{SYSRST}}$ signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state and some are unaffected.

Note: Refer to the specific peripheral section or [Section 4.0 “Memory Organization”](#) of this manual for register Reset states.

All types of device Reset set a corresponding status bit in the RCON register to indicate the type of Reset (see [Register 6-1](#)).

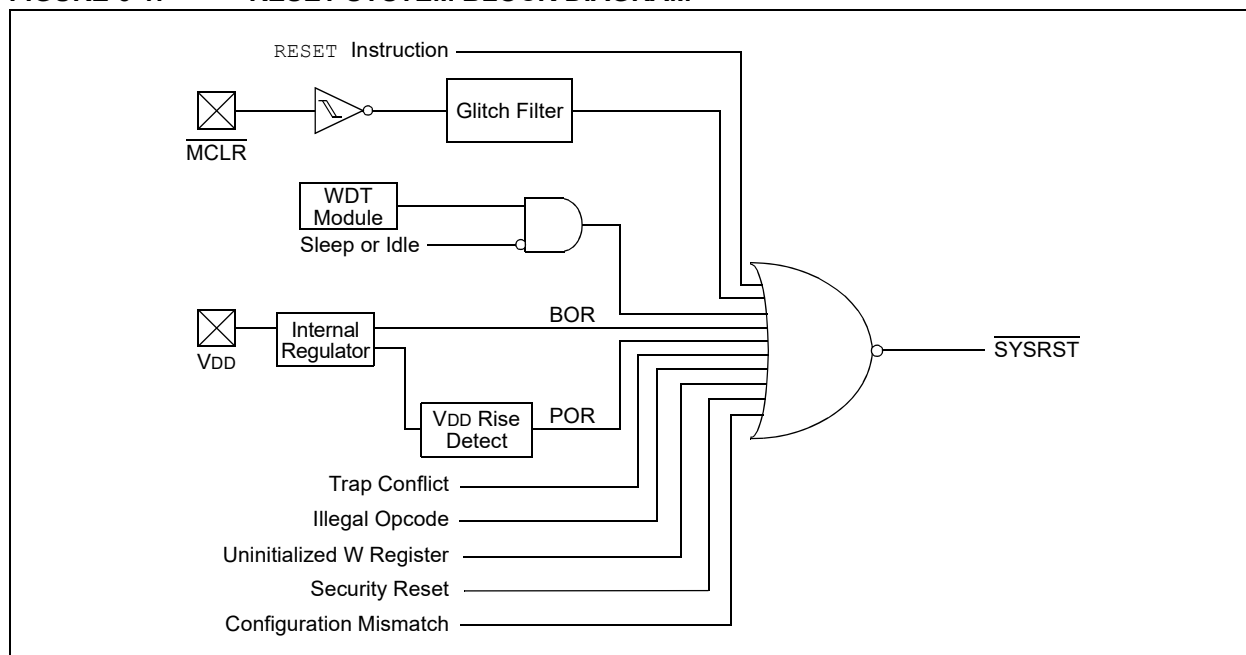

A POR clears all the bits, except for the POR and BOR bits (RCON[1:0]), that are set. The user application can set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this manual.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

For all Resets, the default clock source is determined by the FNOSC[2:0] bits in the FOSCSEL Configuration register. The value of the FNOSC[2:0] bits is loaded into NOSC[2:0] (OSCCON[10:8]) on Reset, which in turn, initializes the system clock.

FIGURE 6-1: RESET SYSTEM BLOCK DIAGRAM

6.1 Reset Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464>

6.1.1 KEY RESOURCES

- “Reset” (www.microchip.com/DS70602) in the “dsPIC33/PIC24 Family Reference Manual”
- Code Samples

REGISTER 6-1: RCON: RESET CONTROL REGISTER⁽¹⁾

| | | | | | | | |
|--------|--------|-----|-----|--------|-----|-------|-------|
| R/W-0 | R/W-0 | U-0 | U-0 | R/W-0 | U-0 | R/W-0 | R/W-0 |
| TRAPR | IOPUWR | — | — | VREGSF | — | CM | VREGS |
| bit 15 | | | | | | bit 8 | |

| | | | | | | | |
|-------|-------|-----------------------|-------|-------|-------|-------|-------|
| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-1 | R/W-1 |
| EXTR | SWR | SWDTEN ⁽²⁾ | WDTO | SLEEP | IDLE | BOR | POR |
| bit 7 | | | | | | bit 0 | |

Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

- bit 15 **TRAPR:** Trap Reset Flag bit
1 = A Trap Conflict Reset has occurred
0 = A Trap Conflict Reset has not occurred
- bit 14 **IOPUWR:** Illegal Opcode or Uninitialized W Access Reset Flag bit
1 = An illegal opcode detection, an illegal address mode or Uninitialized W register used as an Address Pointer caused a Reset
0 = An illegal opcode or Uninitialized W register Reset has not occurred
- bit 13-12 **Unimplemented:** Read as '0'
- bit 11 **VREGSF:** Flash Voltage Regulator Standby During Sleep bit
1 = Flash voltage regulator is active during Sleep
0 = Flash voltage regulator goes into Standby mode during Sleep
- bit 10 **Unimplemented:** Read as '0'
- bit 9 **CM:** Configuration Mismatch Flag bit
1 = A Configuration Mismatch Reset has occurred.
0 = A Configuration Mismatch Reset has not occurred
- bit 8 **VREGS:** Voltage Regulator Standby During Sleep bit
1 = Voltage regulator is active during Sleep
0 = Voltage regulator goes into Standby mode during Sleep
- bit 7 **EXTR:** External Reset ($\overline{\text{MCLR}}$) Pin bit
1 = A Master Clear (pin) Reset has occurred
0 = A Master Clear (pin) Reset has not occurred
- bit 6 **SWR:** Software RESET (Instruction) Flag bit
1 = A RESET instruction has been executed
0 = A RESET instruction has not been executed
- bit 5 **SWDTEN:** Software Enable/Disable of WDT bit⁽²⁾
1 = WDT is enabled
0 = WDT is disabled
- bit 4 **WDTO:** Watchdog Timer Time-out Flag bit
1 = WDT time-out has occurred
0 = WDT time-out has not occurred

Note 1: All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

2: If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

REGISTER 6-1: RCON: RESET CONTROL REGISTER⁽¹⁾ (CONTINUED)

| | |
|-------|---|
| bit 3 | SLEEP: Wake-up from Sleep Flag bit 1 = Device has been in Sleep mode 0 = Device has not been in Sleep mode |
| bit 2 | IDLE: Wake-up from Idle Flag bit 1 = Device was in Idle mode 0 = Device was not in Idle mode |
| bit 1 | BOR: Brown-out Reset Flag bit 1 = A Brown-out Reset has occurred 0 = A Brown-out Reset has not occurred |
| bit 0 | POR: Power-on Reset Flag bit 1 = A Power-on Reset has occurred 0 = A Power-on Reset has not occurred |

- Note 1:** All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.
- 2:** If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

7.0 INTERRUPT CONTROLLER

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Interrupts**” (www.microchip.com/DS70000600) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X CPU.

The interrupt controller has the following features:

- Up to Eight Processor Exceptions and Software Traps
- Eight User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with a Unique Vector for Each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Fixed Interrupt Entry and Return Latencies

7.1 Interrupt Vector Table

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X Interrupt Vector Table (IVT), shown in [Figure 7-1](#), resides in program memory starting at location, 000004h. The IVT contains seven non-maskable trap vectors and up to 246 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with Vector 0 takes priority over interrupts at any other vector address.

7.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices clear their registers in response to a Reset, which forces the PC to zero. The device then begins program execution at location, 0x000000. A GOTO instruction at the Reset address can redirect program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

7.3 Interrupt Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464>

7.3.1 KEY RESOURCES

- “**Interrupts**” (www.microchip.com/DS70000600) in the “*dsPIC33/PIC24 Family Reference Manual*”
- Code Samples
- Application Notes
- Software Libraries
- Webinars
- All Related “*dsPIC33/PIC24 Family Reference Manual*” Sections
- Development Tools

7.4 Interrupt Control and Status Registers

dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices implement the following registers for the interrupt controller:

- INTCON1
- INTCON2
- INTCON3
- INTCON4
- INTTREG

7.4.1 INTCON1 THROUGH INTCON4

Global interrupt control functions are controlled from INTCON1, INTCON2, INTCON3 and INTCON4.

INTCON1 contains the Interrupt Nesting Disable (NSTDIS) bit, as well as the control and status flags for the processor trap sources.

The INTCON2 register controls external interrupt request signal behavior and also contains the Global Interrupt Enable (GIE) bit.

INTCON3 contains the status flags for the DMA and DO stack overflow status trap sources.

The INTCON4 register contains the Software-Generated Hard Trap (SGHT) status bit.

7.4.2 IFSx

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared via software.

7.4.3 IECx

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

7.4.4 IPCx

The IPCx registers are used to set the Interrupt Priority Level (IPL) for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

7.4.5 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into the Vector Number bits (VECNUM[7:0]) and Interrupt Priority Level bits (ILR[3:0]) fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence as they are listed in [Table 7-1](#). For example, the INT0 (External Interrupt 0) is shown as having Vector Number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0[0], the INT0IE bit in IEC0[0] and the INT0IP bits in the first position of IPC0 (IPC0[2:0]).

7.4.6 STATUS/CONTROL REGISTERS

Although these registers are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality. For more information on these registers refer to “**CPU**” (www.microchip.com/DS70359) in the “*dsPIC33/PIC24 Family Reference Manual*”.

- The CPU STATUS Register, SR, contains the IPL[2:0] bits (SR[7:5]). These bits indicate the current CPU Interrupt Priority Level. The user software can change the current CPU Interrupt Priority Level by writing to the IPLx bits.
- The CORCON register contains the IPL3 bit which, together with IPL[2:0], also indicates the current CPU priority level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

All Interrupt registers are described in [Register 7-3](#) through [Register 7-7](#) in the following pages.

REGISTER 7-1: SR: CPU STATUS REGISTER⁽¹⁾

| | | | | | | | |
|--------|-------|-------|-------|-------|-------|-----|-------|
| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/C-0 | R/C-0 | R-0 | R/W-0 |
| OA | OB | SA | SB | OAB | SAB | DA | DC |
| bit 15 | | | | | | | bit 8 |

| | | | | | | | |
|-------------------------|----------------------|----------------------|-----|-------|-------|-------|-------|
| R/W-0 ⁽³⁾ | R/W-0 ⁽³⁾ | R/W-0 ⁽³⁾ | R-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| IPL[2:0] ⁽²⁾ | | | RA | N | OV | Z | C |
| bit 7 | | | | | | | bit 0 |

| | | | |
|-------------------|-------------------|------------------------------------|--------------------|
| Legend: | C = Clearable bit | | |
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 7-5 **IPL[2:0]: CPU Interrupt Priority Level Status bits^(2,3)**

111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled
 110 = CPU Interrupt Priority Level is 6 (14)
 101 = CPU Interrupt Priority Level is 5 (13)
 100 = CPU Interrupt Priority Level is 4 (12)
 011 = CPU Interrupt Priority Level is 3 (11)
 010 = CPU Interrupt Priority Level is 2 (10)
 001 = CPU Interrupt Priority Level is 1 (9)
 000 = CPU Interrupt Priority Level is 0 (8)

Note 1: For complete register details, see [Register 3-1](#).

2: The IPL[2:0] bits are concatenated with the IPL[3] bit (CORCON[3]) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL[3] = 1. User interrupts are disabled when IPL[3] = 1.

3: The IPL[2:0] Status bits are read-only when the NSTDIS bit (INTCON1[15]) = 1.

8.0 DIRECT MEMORY ACCESS (DMA)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Direct Memory Access (DMA)**” (www.microchip.com/DS70348) in the “*dsPIC33/PIC24 Family Reference Manual*”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The DMA Controller transfers data between Peripheral Data registers and Data Space SRAM.

In addition, DMA can access the entire data memory space. The Data Memory Bus Arbiter is utilized when either the CPU or DMA attempts to access SRAM, resulting in potential DMA or CPU stalls.

The DMA Controller supports four independent channels. Each channel can be configured for transfers to or from selected peripherals. Some of the peripherals supported by the DMA Controller include:

- ECAN™
- Analog-to-Digital Converter (ADC)
- Serial Peripheral Interface (SPI)
- UART
- Input Capture
- Output Compare

Refer to [Table 8-1](#) for a complete list of supported peripherals.

FIGURE 8-1: DMA CONTROLLER MODULE

In addition, DMA transfers can be triggered by timers as well as external interrupts. Each DMA channel is unidirectional. Two DMA channels must be allocated to read and write to a peripheral. If more than one channel receives a request to transfer data, a simple fixed priority scheme based on channel number, dictates which channel completes the transfer and which channel, or channels, are left pending. Each DMA channel moves a block of data, after which, it generates an interrupt to the CPU to indicate that the block is available for processing.

The DMA Controller provides these functional capabilities:

- Four DMA channels
- Register Indirect with Post-Increment Addressing mode
- Register Indirect without Post-Increment Addressing mode

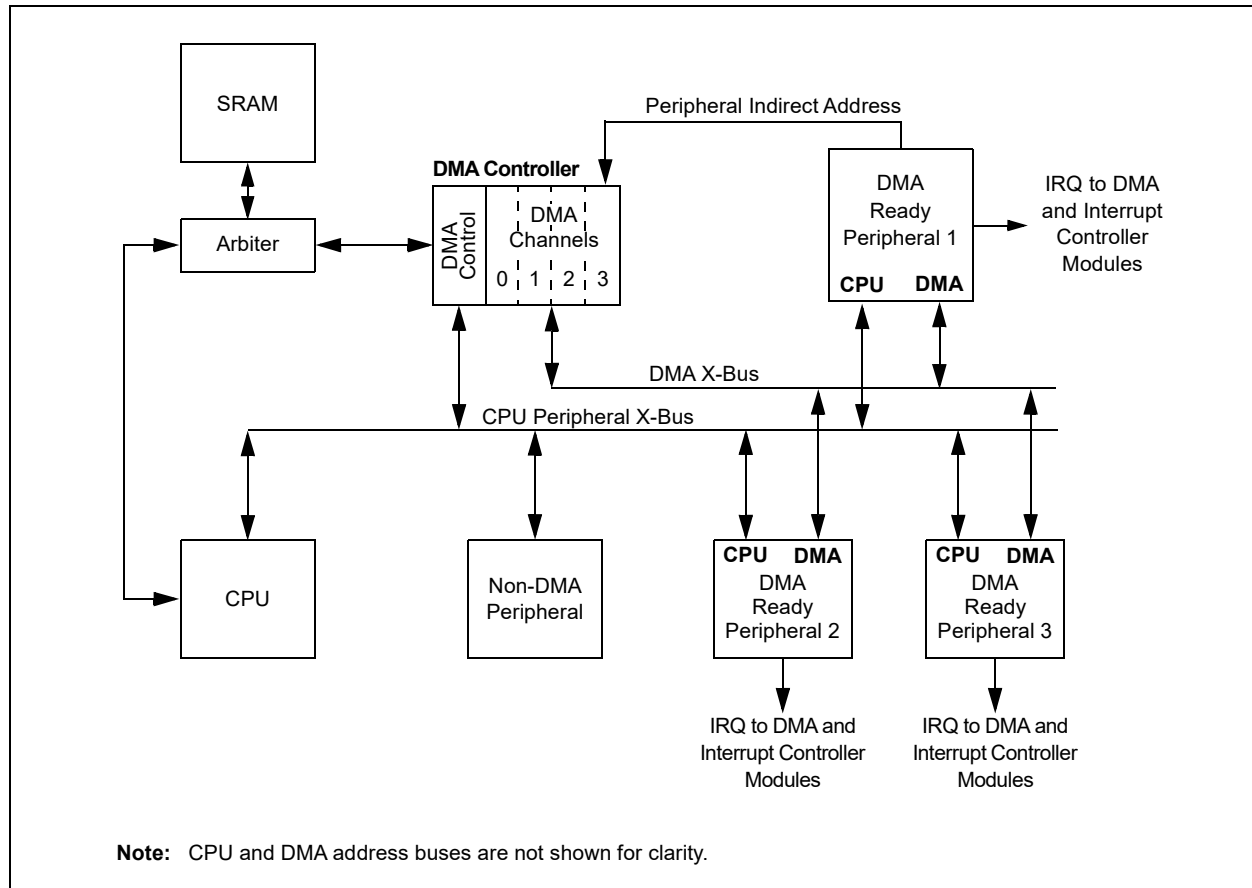

- Peripheral Indirect Addressing mode (peripheral generates destination address)
- CPU interrupt after half or full block transfer complete
- Byte or word transfers
- Fixed priority channel arbitration
- Manual (software) or automatic (peripheral DMA requests) transfer initiation
- One-Shot or Auto-Repeat Block Transfer modes
- Ping-Pong mode (automatic switch between two SRAM start addresses after each block transfer is complete)
- DMA request for each channel can be selected from any supported interrupt source
- Debug support features

The peripherals that can utilize DMA are listed in [Table 8-1](#).

TABLE 8-1: DMA CHANNEL TO PERIPHERAL ASSOCIATIONS

| Peripheral to DMA Association | DMAxREQ Register IRQSEL[7:0] Bits | DMAxPAD Register (Values to Read from Peripheral) | DMAxPAD Register (Values to Write to Peripheral) |

8.1 DMA Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464>

8.1.1 KEY RESOURCES

- “Direct Memory Access (DMA)” (www.microchip.com/DS70348) in the “dsPIC33/PIC24 Family Reference Manual”
- Code Samples
- Application Notes
- Software Libraries
- Webinars
- All Related “dsPIC33/PIC24 Family Reference Manual” Sections
- Development Tools

8.2 DMAC Registers

Each DMAC Channel x (where $x = 0$ through 3) contains the following registers:

- 16-Bit DMA Channel Control register (DMAxCON)
- 16-Bit DMA Channel IRQ Select register (DMAxREQ)
- 32-Bit DMA RAM Primary Start Address register (DMAxSTA)
- 32-Bit DMA RAM Secondary Start Address register (DMAxSTB)
- 16-Bit DMA Peripheral Address register (DMAxPAD)
- 14-Bit DMA Transfer Count register (DMAxCNT)

Additional status registers (DMAPWC, DMARQC, DMAPPS, DMALCA and DSADR) are common to all DMAC channels. These status registers provide information on write and request collisions, as well as on last address and channel access information.

The interrupt flags (DMAxIF) are located in an IFSx register in the interrupt controller. The corresponding interrupt enable control bits (DMAxIE) are located in an IECx register in the interrupt controller, and the corresponding interrupt priority control bits (DMAxIP) are located in an IPCx register in the interrupt controller.

NOTES:

9.0 OSCILLATOR CONFIGURATION

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Oscillator**” (www.microchip.com/DS70580) in the “dsPIC33/PIC24 Family Reference Manual”.

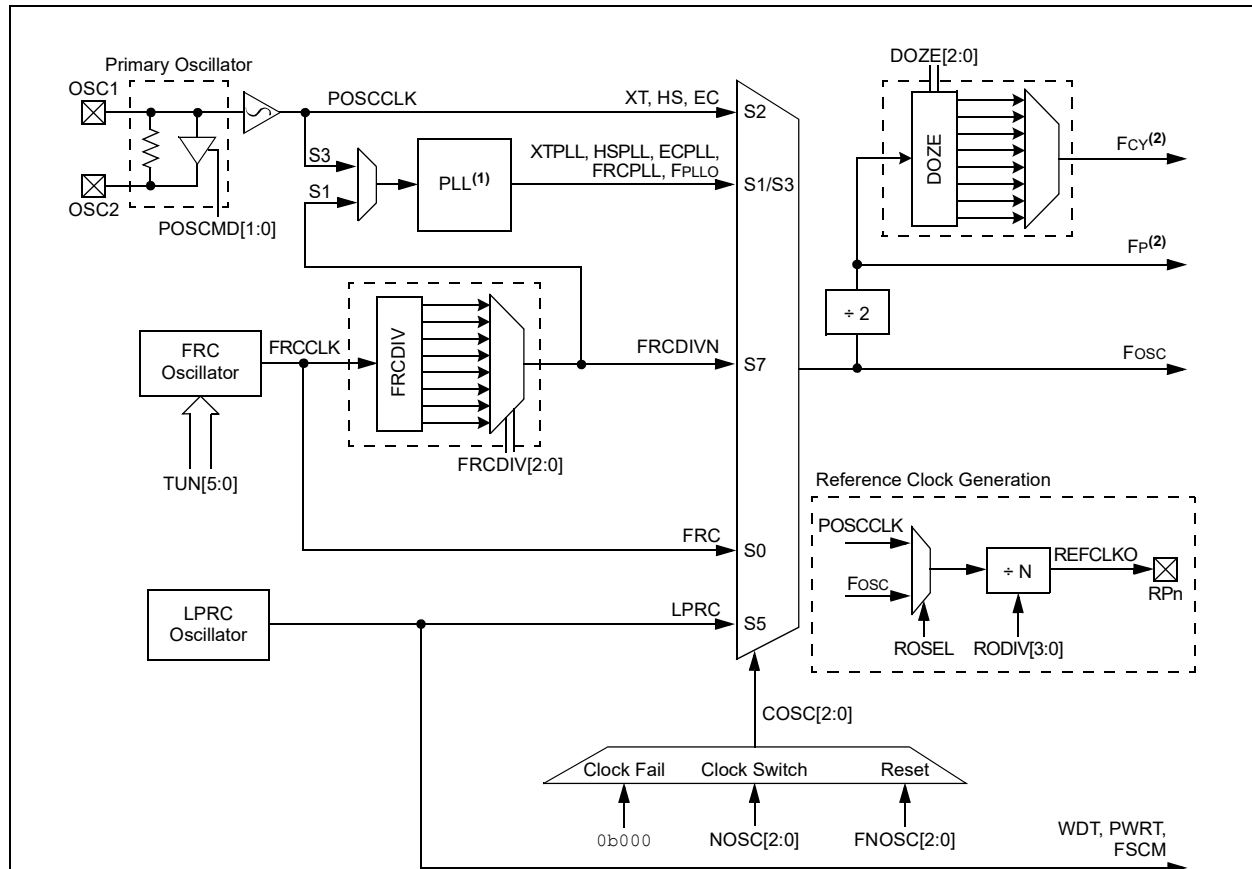

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X oscillator system provides:

- On-Chip Phase-Locked Loop (PLL) to Boost Internal Operating Frequency on Select Internal and External Oscillator Sources
- On-the-Fly Clock Switching between Various Clock Sources
- Doze mode for System Power Savings
- Fail-Safe Clock Monitor (FSCM) that Detects Clock Failure and Permits Safe Application Recovery or Shutdown
- Configuration Bits for Clock Source Selection

A simplified diagram of the oscillator system is shown in **Figure 9-1**.

FIGURE 9-1: OSCILLATOR SYSTEM DIAGRAM

Note 1: See **Figure 9-2** for PLL details.

2: The term, FP, refers to the clock source for all peripherals, while Fcy refers to the clock source for the CPU. Throughout this document, Fcy and FP are used interchangeably, except in the case of Doze mode. FP and Fcy will be different when Doze mode is used with a doze ratio of 1:2 or lower.

9.1 CPU Clocking System

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X family of devices provides six system clock options:

- Fast RC (FRC) Oscillator
- FRC Oscillator with Phase-Locked Loop (PLL)
- FRC Oscillator with Postscaler
- Primary (XT, HS or EC) Oscillator
- Primary Oscillator with PLL
- Low-Power RC (LPRC) Oscillator

Instruction execution speed or device operating frequency, F_{CY} , is given by [Equation 9-1](#).

EQUATION 9-1: DEVICE OPERATING FREQUENCY

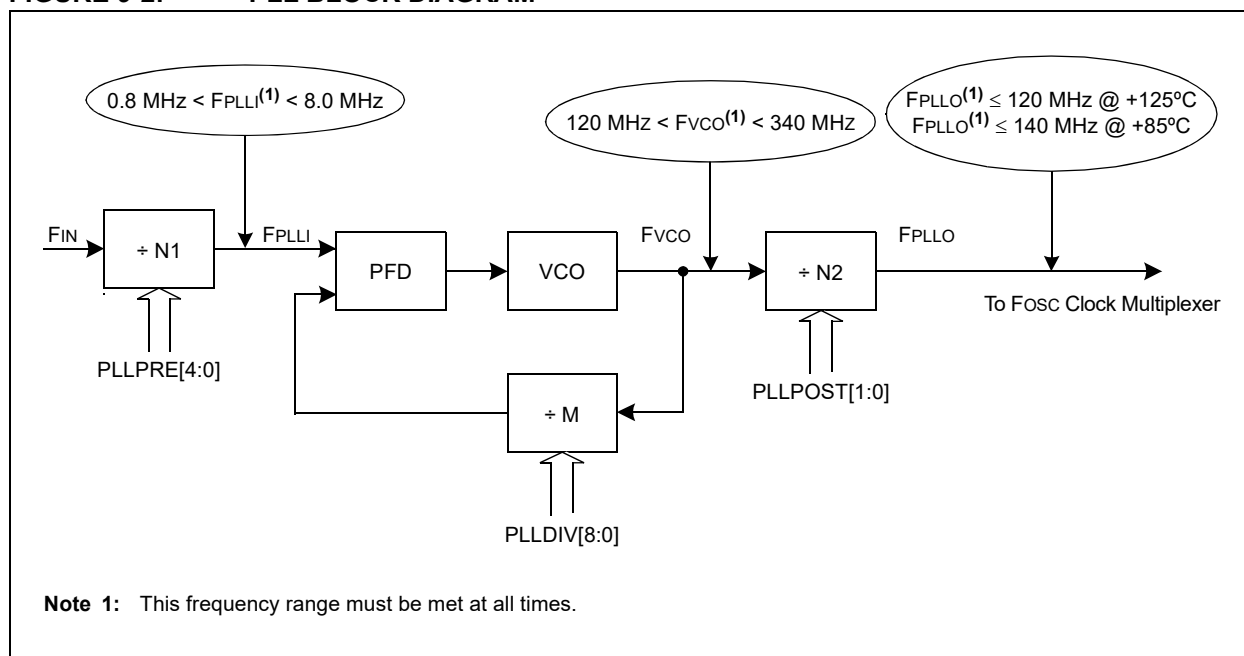

$$F_{CY} = F_{osc}/2$$

[Figure 9-2](#) is a block diagram of the PLL module.

[Equation 9-2](#) provides the relationship between input frequency (F_{IN}) and output frequency (F_{PLLO}). In clock modes S1 and S3, when the PLL output is selected, $F_{OSC} = F_{PLLO}$.

[Equation 9-3](#) provides the relationship between input frequency (F_{IN}) and VCO frequency (F_{VCO}).

FIGURE 9-2: PLL BLOCK DIAGRAM

EQUATION 9-2: F_{PLLO} CALCULATION

$$F_{PLLO} = F_{IN} \times \left(\frac{M}{N1 \times N2} \right) = F_{IN} \times \left(\frac{(PLLDIV + 2)}{(PLLPRE + 2) \times 2(PLLPOST + 1)} \right)$$

Where:

$$N1 = PLLPRE + 2$$

$$N2 = 2 \times (PLLPOST + 1)$$

$$M = PLLDIV + 2$$

EQUATION 9-3: F_{VCO} CALCULATION

$$F_{VCO} = F_{IN} \times \left(\frac{M}{N1} \right) = F_{IN} \times \left(\frac{(PLLDIV + 2)}{(PLLPRE + 2)} \right)$$

TABLE 9-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION

| Oscillator Mode | Oscillator Source | POSCMD[1:0] | FNOSC[2:0] | See Notes |
|--|-------------------|-------------|------------|-----------|
| Fast RC Oscillator with Divide-by-N (FRCDIVN) | Internal | xx | 111 | 1, 2 |
| Low-Power RC Oscillator (LPRC) | Internal | xx | 101 | 1 |
| Primary Oscillator (HS) with PLL (HSPLL) | Primary | 10 | 011 | |
| Primary Oscillator (XT) with PLL (XTPLL) | Primary | 01 | 011 | |
| Primary Oscillator (EC) with PLL (ECPLL) | Primary | 00 | 011 | 1 |
| Primary Oscillator (HS) | Primary | 10 | 010 | |
| Primary Oscillator (XT) | Primary | 01 | 010 | |
| Primary Oscillator (EC) | Primary | 00 | 010 | 1 |
| Fast RC Oscillator (FRC) with Divide-by-N and PLL (FRCPLL) | Internal | xx | 001 | 1 |
| Fast RC Oscillator (FRC) | Internal | xx | 000 | 1 |

Note 1: OSC2 pin function is determined by the OSCIOFNC Configuration bit.

2: This is the default oscillator mode for an unprogrammed (erased) device.

9.2 Oscillator Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464>

9.2.1 KEY RESOURCES

| bit 15 | | | | bit 8 | | | |

| | | | | | | | |
|---------|--------|------|-----|-------------------|-----|-----|-------|
| R/W-0 | R/W-0 | R-0 | U-0 | R/W-0 | U-0 | U-0 | R/W-0 |
| CLKLOCK | IOLOCK | LOCK | — | CF ⁽³⁾ | — | — | OSWEN |
| bit 7 | | | | bit 0 | | | |

Legend: y = Value set from Configuration bits on POR
R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
-n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 15 **Unimplemented:** Read as '0'

bit 14-12 **COSC[2:0]:** Current Oscillator Selection bits (read-only)

111 = Fast RC Oscillator (FRC) with Divide-by-n
110 = Fast RC Oscillator (FRC) with Divide-by-16
101 = Low-Power RC Oscillator (LPRC)
100 = Reserved
011 = Primary Oscillator (XT, HS, EC) with PLL
010 = Primary Oscillator (XT, HS, EC)
001 = Fast RC Oscillator (FRC) with Divide-by-N and PLL (FRCPLL)
000 = Fast RC Oscillator (FRC)

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **NOSC[2:0]:** New Oscillator Selection bits⁽²⁾

111 = Fast RC Oscillator (FRC) with Divide-by-n
110 = Fast RC Oscillator (FRC) with Divide-by-16
101 = Low-Power RC Oscillator (LPRC)
100 = Reserved
011 = Primary Oscillator (XT, HS, EC) with PLL
010 = Primary Oscillator (XT, HS, EC)
001 = Fast RC Oscillator (FRC) with Divide-by-N and PLL (FRCPLL)
000 = Fast RC Oscillator (FRC)

bit 7 **CLKLOCK:** Clock Lock Enable bit

1 = If (FCKSM0 = 1), then clock and PLL configurations are locked; if (FCKSM0 = 0), then clock and PLL configurations may be modified
0 = Clock and PLL selections are not locked, configurations may be modified

bit 6 **IOLOCK:** I/O Lock Enable bit

1 = I/O lock is active
0 = I/O lock is not active

bit 5 **LOCK:** PLL Lock Status bit (read-only)

1 = Indicates that PLL is in lock or PLL start-up timer is satisfied
0 = Indicates that PLL is out of lock, start-up timer is in progress or PLL is disabled

Note 1: Writes to this register require an unlock sequence. Refer to “**Oscillator**” (www.microchip.com/DS70580) in the “*dsPIC33/PIC24 Family Reference Manual*” (available from the Microchip website) for details.

2: Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transitional clock source between the two PLL modes.

3: This bit should only be cleared in software. Setting the bit in software (= 1) will have the same effect as an actual oscillator failure and trigger an oscillator failure trap.

REGISTER 9-1: OSCCON: OSCILLATOR CONTROL REGISTER⁽¹⁾ (CONTINUED)

| | |
|---------|--|
| bit 4 | Unimplemented: Read as '0' |
| bit 3 | CF: Clock Fail Detect bit ⁽³⁾ 1 = FSCM has detected clock failure 0 = FSCM has not detected clock failure |
| bit 2-1 | Unimplemented: Read as '0' |
| bit 0 | OSWEN: Oscillator Switch Enable bit 1 = Requests oscillator switch to selection specified by the NOSC[2:0] bits 0 = Oscillator switch is complete |

- Note 1:** Writes to this register require an unlock sequence. Refer to “**Oscillator**” (www.microchip.com/DS70580) in the “*dsPIC33/PIC24 Family Reference Manual*” (available from the Microchip website) for details.
- 2:** Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transitional clock source between the two PLL modes.
- 3:** This bit should only be cleared in software. Setting the bit in software (= 1) will have the same effect as an actual oscillator failure and trigger an oscillator failure trap.

REGISTER 9-2: CLKDIV: CLOCK DIVISOR REGISTER

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15 **ROI:** Recover on Interrupt bit

1 = Interrupts will clear the DOZEN bit

0 = Interrupts have no effect on the DOZEN bit

bit 14-12 **DOZE[2:0]:** Processor Clock Reduction Select bits⁽¹⁾

111 = Fcy divided by 128

110 = Fcy divided by 64

101 = Fcy divided by 32

100 = Fcy divided by 16

011 = Fcy divided by 8 (default)

010 = Fcy divided by 4

001 = Fcy divided by 2

000 = Fcy divided by 1

bit 11 **DOZEN:** Doze Mode Enable bit^(2,3)

1 = DOZE[2:0] field specifies the ratio between the peripheral clocks and the processor clocks

0 = Processor clock and peripheral clock ratio is forced to 1:1

bit 10-8 **FRCDIV[2:0]:** Internal Fast RC Oscillator Postscaler bits

111 = FRC divided by 256

110 = FRC divided by 64

101 = FRC divided by 32

100 = FRC divided by 16

011 = FRC divided by 8

010 = FRC divided by 4

001 = FRC divided by 2

000 = FRC divided by 1 (default)

bit 7-6 **PLLPOST[1:0]:** PLL VCO Output Divider Select bits (also denoted as 'N2', PLL postscaler)

11 = Output divided by 8

10 = Reserved

01 = Output divided by 4 (default)

00 = Output divided by 2

bit 5 **Unimplemented:** Read as '0'

Note 1: The DOZE[2:0] bits can only be written to when the DOZEN bit is clear. If DOZEN = 1, any writes to DOZE[2:0] are ignored.

2: This bit is cleared when the ROI bit is set and an interrupt occurs.

3: The DOZEN bit cannot be set if DOZE[2:0] = 000. If DOZE[2:0] = 000, any attempt by user software to set the DOZEN bit is ignored.

REGISTER 9-2: CLKDIV: CLOCK DIVISOR REGISTER (CONTINUED)

bit 4-0 **PLLPRE[4:0]:** PLL Phase Detector Input Divider Select bits (also denoted as 'N1', PLL prescaler)

11111 = Input divided by 33

•

•

•

00001 = Input divided by 3

00000 = Input divided by 2 (default)

- Note 1:** The DOZE[2:0] bits can only be written to when the DOZEN bit is clear. If DOZEN = 1, any writes to DOZE[2:0] are ignored.
- 2:** This bit is cleared when the ROI bit is set and an interrupt occurs.
- 3:** The DOZEN bit cannot be set if DOZE[2:0] = 000. If DOZE[2:0] = 000, any attempt by user software to set the DOZEN bit is ignored.

10.0 POWER-SAVING FEATURES

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Watchdog Timer and Power-Saving Modes**” (www.microchip.com/DS70615) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of peripherals being clocked constitutes lower consumed power.

dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices can manage power consumption in four ways:

- Clock Frequency
- Instruction-Based Sleep and Idle modes
- Software-Controlled Doze mode
- Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application's power consumption while still maintaining critical application features, such as timing-sensitive communications.

EXAMPLE 10-1: PWRSAV INSTRUCTION SYNTAX

```
PWRSAV #IDLE_MODE      ; Put the device into Idle mode
PWRSAV #SLEEP_MODE     ; Put the device into Sleep mode(1)
```

Note 1: The use of PWRSAV #SLEEP_MODE has limitations when the Flash Voltage Regulator bit, VREGSF (RCON[11]), is set to Standby mode. Refer to [Section 10.2.1 “Sleep Mode”](#) for more information.

10.1 Clock Frequency and Clock Switching

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSC_x bits (OSCCON[10:8]). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in [Section 9.0 “Oscillator Configuration”](#).

10.2 Instruction-Based Power-Saving Modes

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the PWRSAV instruction is shown in [Example 10-1](#).

Note: SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to “wake-up”.

10.2.1 SLEEP MODE

The following occurs in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled.
- The LPRC clock continues to run in Sleep mode if the WDT is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals can continue to operate. This includes items such as the Input Change Notification (ICN) on the I/O ports or peripherals that use an external clock input.
- Any peripheral that requires the system clock source for its operation is disabled.

The device wakes up from Sleep mode on any of these events:

- Any interrupt source that is individually enabled
- Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

For optimal power savings, the internal regulator and the Flash regulator can be configured to go into standby when Sleep mode is entered by clearing the VREGS (RCON[8]) and VREGSF (RCON[11]) bits (default configuration). However, putting the Flash voltage regulator in Standby mode (VREGSF = 0) when in Sleep has the effect of corrupting the prefetched instructions placed in the instruction queue. When the part wakes up, these instructions may cause undefined behavior. To remove this problem, the instruction queue must be flushed after the part wakes up. A way to flush the instruction queue is to perform a branch. Therefore, it is required to implement the `SLEEP` instruction in a function with 4-instruction word alignment. The 4-instruction word alignment will assure that the `SLEEP` instruction is always placed on the correct address to make sure the flushing will be effective. [Example 10-2](#) shows how this is performed.

EXAMPLE 10-2: SLEEP MODE `PWRSV` INSTRUCTION SYNTAX (WITH FLASH VOLTAGE REGULATOR SET TO STANDBY MODE)

```
.global      _GoToSleep
.section    .text
.align      4

_GoToSleep:

PWRSV      #SLEEP_MODE
BRA        TO_FLUSH_QUEUE_LABEL
TO_FLUSH_QUEUE_LABEL:
RETURN
```

If the application requires a faster wake-up time, and can accept higher current requirements, the VREGS (RCON[8]) and VREGSF (RCON[11]) bits can be set to keep the internal regulator and the Flash regulator active during Sleep mode.

10.2.2 IDLE MODE

The following occurs in Idle mode:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see [Section 10.4 “Peripheral Module Disable”](#)).
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device wakes from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (two-four clock cycles later), starting with the instruction following the `PWRSV` instruction or the first instruction in the Interrupt Service Routine (ISR).

All peripherals also have the option to discontinue operation when Idle mode is entered to allow for increased power savings. This option is selectable in the control register of each peripheral; for example, the `TSIDL` bit in the Timer1 Control register (`T1CON[13]`).

10.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a `PWRSV` instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

10.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this cannot be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is

reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the `DOZEN` bit (`CLKDIV[11]`). The ratio between peripheral and core clock speed is determined by the `DOZE[2:0]` bits (`CLKDIV[14:12]`). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU Idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the `ROI` bit (`CLKDIV[15]`). By default, interrupt events have no effect on Doze mode operation.

For example, suppose the device is operating at 20 MIPS and the ECAN™ module has been configured for 500 kbps, based on this device operating speed. If the device is placed in Doze mode with a clock frequency ratio of 1:4, the ECAN module continues to communicate at the required bit rate of 500 kbps, but the CPU now starts executing instructions at a frequency of 5 MIPS.

10.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have effect and read values are invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC® DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

Note: If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation).

10.5 Power-Saving Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

11.0 I/O PORTS

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “I/O Ports” (www.microchip.com/DS70000598) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

Many of the device pins are shared among the peripherals and the parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

11.1 Parallel I/O (PIO) Ports

Generally, a parallel I/O port that shares a pin with a peripheral is subservient to the peripheral. The peripheral’s output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port

has ownership of the output data and control signals of the I/O pin. The logic also prevents “loop through,” in which a port’s digital output can drive the input of a peripheral that shares the same pin. [Figure 11-1](#) illustrates how ports are shared with other peripherals and the associated I/O pin to which they are connected.

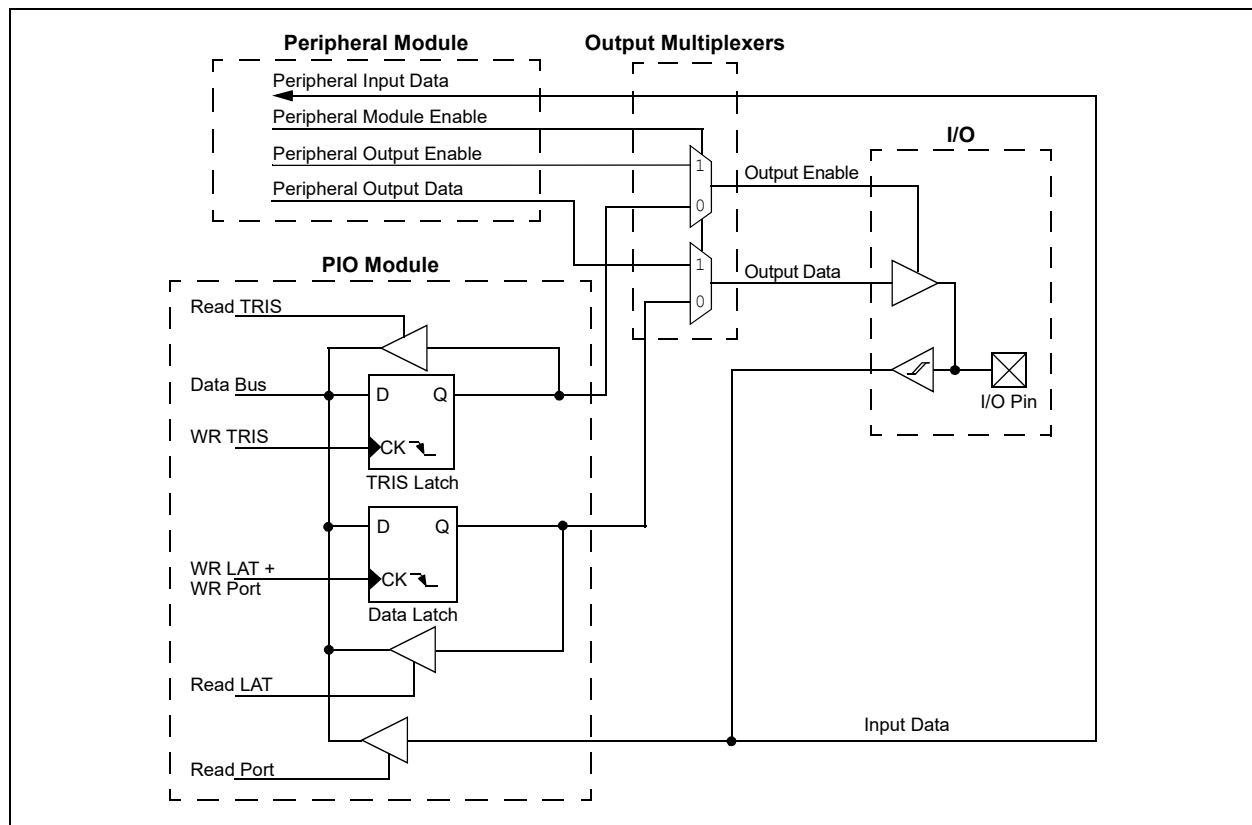

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin can be read, but the output driver for the parallel port bit is disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin can be driven by a port.

All port pins have eight registers directly associated with their operation as digital I/O. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a ‘1’, then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the Latch register (LATx) read the latch. Writes to the Latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

Any bit and its associated data and control registers that are not valid for a particular device is disabled. This means the corresponding LATx and TRISx registers and the port pin are read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs.

FIGURE 11-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE

11.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx and TRISx registers for data control, port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs other than VDD by using external pull-up resistors. The maximum open-drain voltage allowed on any pin is the same as the maximum VIH specification for that particular pin.

See the “Pin Diagrams” section for the available 5V tolerant pins and Table 30-11 for the maximum VIH specification for each pin.

11.2 Configuring Analog and Digital Port Pins

The ANSELx register controls the operation of the analog port pins. The port pins that are to function as analog inputs or outputs must have their corresponding ANSELx and TRISx bits set. In order to use port pins for I/O functionality with digital modules, such as Timers, UARTs, etc., the corresponding ANSELx bit must be cleared. When ANSELx = 1 (the port is selected as analog) and TRISx = 1 (digital I/O enabled), the digital input value read by the port is always ‘0’.

The ANSELx register has a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

Pins with analog functions affected by the ANSELx registers are listed with a buffer type of analog in the Pinout I/O Descriptions (see Table 1-1).

If the TRISx bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or comparator module.

When the PORTx register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

11.2.1 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be a NOP, as shown in Example 11-1.

11.3 Input Change Notification (ICN)

The Input Change Notification function of the I/O ports allows devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a Change-of-State.

Three control registers are associated with the Change Notification (CN) functionality of each I/O port. The CNENx registers contain the CN interrupt enable control bits for each of the input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups and pull-downs act as a current source or sink source connected to the pin and eliminate the need for external resistors when push button, or keypad devices are connected. The pull-ups and pull-downs are enabled separately, using the CNPUx and the CNPDx registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

Note: Pull-ups and pull-downs on Change Notification pins should always be disabled when the port pin is configured as a digital output.

EXAMPLE 11-1: PORT WRITE/READ EXAMPLE

```
MOV    0xFF00, W0    ; Configure PORTB<15:8>
                        ; as inputs
MOV    W0, TRISB      ; and PORTB<7:0>
                        ; as outputs
NOP                      ; Delay 1 cycle
BTSS   PORTB, #13     ; Next Instruction
```

11.4 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient workarounds in application code, or a complete redesign, may be the only option.

Peripheral Pin Select configuration provides an alternative to these choices by enabling peripheral set selection and their placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The Peripheral Pin Select configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to any one of these I/O pins. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

11.4.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the Peripheral Pin Select feature include the label, “RPn” or “RPI n”, in their full pin designation, where “n” is the remappable pin number. “RP” is used to designate pins that support both remappable input and output functions, while “RPI” indicates pins that support remappable input functions only.

11.4.2 AVAILABLE PERIPHERALS

The peripherals managed by the Peripheral Pin Select are all digital-only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer-related peripherals (input capture and output compare) and interrupt-on-change inputs.

In comparison, some digital-only peripheral modules are never included in the Peripheral Pin Select feature. This is because the peripheral's function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include I²C and the PWM. A similar requirement excludes all modules with analog inputs, such as the ADC Converter.

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/O and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

11.4.3 CONTROLLING PERIPHERAL PIN SELECT

Peripheral Pin Select features are controlled through two sets of SFRs: one to map peripheral inputs and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

11.4.4 INPUT MAPPING

The inputs of the Peripheral Pin Select options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The RPINRx registers are used to configure peripheral input mapping (see [Register 11-1](#) through [Register 11-17](#)). Each register contains sets of 7-bit fields, with each set associated with one of the remappable peripherals. Programming a given peripheral's bit field with an appropriate 7-bit value maps the RPn pin with the corresponding value to that peripheral. For any given device, the valid range of values for any bit field corresponds to the maximum number of Peripheral Pin Selections supported by the device.

For example, [Figure 11-2](#) illustrates remappable pin selection for the U1RX input.

FIGURE 11-2: REMAPPABLE INPUT FOR U1RX

11.4.4.1 Virtual Connections

dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices support virtual (internal) connections to the output of the op amp/comparator module (see [Figure 25-1](#) in [Section 25.0 “Op Amp/Comparator Module”](#)) and the PTG module (see [Section 24.0 “Peripheral Trigger Generator \(PTG\) Module”](#)).

In addition, dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices support virtual connections to the filtered QE1 module inputs: FINDX1, FHOME1, FINDX2 and FHOME2 (see [Figure 17-1](#) in [Section 17.0 “Quadrature Encoder Interface \(QE1\) Module \(dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X Devices Only\)”](#)).

Virtual connections provide a simple way of inter-peripheral connection without utilizing a physical pin. For example, by setting the FLT1R[6:0] bits of the RPINR12 register to the value of 'b0000001', the output of the analog comparator, C1OUT, will be connected to the PWM Fault 1 input, which allows the analog comparator to trigger PWM Faults without the use of an actual physical pin on the device.

Virtual connection to the QE1 module allows peripherals to be connected to the QE1 digital filter input. To utilize this filter, the QE1 module must be enabled and its inputs must be connected to a physical RPn pin. [Example 11-2](#) illustrates how the input capture module can be connected to the QE1 digital filter.

EXAMPLE 11-2: CONNECTING IC1 TO THE HOME1 QE1 DIGITAL FILTER INPUT ON PIN 43 OF THE dsPIC33EPXXXMC206 DEVICE

```
RPINR15 = 0x2500;    /* Connect the QE1 HOME1 input to RP37 (pin 43) */
RPINR7  = 0x009;    /* Connect the IC1 input to the digital filter on the FHOME1 input */

QE1IOC = 0x4000;    /* Enable the QE1 digital filter */
QE1CON = 0x8000;    /* Enable the QE1 module */
```

TABLE 11-1: SELECTABLE INPUT SOURCES (MAPS INPUT TO FUNCTION)

| Input Name ⁽¹⁾ | Function Name | Register | Configuration Bits |
|---|---------------|----------|--------------------|
| External Interrupt 1 | INT1 | RPINR0 | INT1R[6:0] |
| External Interrupt 2 | INT2 | RPINR1 | INT2R[6:0] |
| Timer2 External Clock | T2CK | RPINR3 | T2CKR[6:0] |
| Input Capture 1 | IC1 | RPINR7 | IC1R[6:0] |
| Input Capture 2 | IC2 | RPINR7 | IC2R[6:0] |
| Input Capture 3 | IC3 | RPINR8 | IC3R[6:0] |
| Input Capture 4 | IC4 | RPINR8 | IC4R[6:0] |
| Output Compare Fault A | OCFA | RPINR11 | OCFAR[6:0] |
| PWM Fault 1 ⁽³⁾ | FLT1 | RPINR12 | FLT1R[6:0] |
| PWM Fault 2 ⁽³⁾ | FLT2 | RPINR12 | FLT2R[6:0] |
| QE11 Phase A ⁽³⁾ | QEA1 | RPINR14 | QEA1R[6:0] |
| QE11 Phase B ⁽³⁾ | QEB1 | RPINR14 | QEB1R[6:0] |

Legend: Shaded rows indicate PPS Input register values that are unimplemented.

Note 1: See [Section 11.4.4.1 “Virtual Connections”](#) for more information on selecting this pin assignment.

2: These inputs are available on dsPIC33EPXXXGP/MC50X devices only.

11.4.4.2 Output Mapping

In contrast to inputs, the outputs of the Peripheral Pin Select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Like the RPINRx registers, each register contains sets of 6-bit fields, with each set associated with one RPn pin (see [Register 11-18](#) through [Register 11-27](#)). The value of the bit field corresponds to one of the peripherals and that peripheral's output is mapped to the pin (see [Table 11-3](#) and [Figure 11-3](#)).

A null output is associated with the output register Reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

FIGURE 11-3: MULTIPLEXING REMAPPABLE OUTPUT FOR RPn

11.4.4.3 Mapping Limitations

The control schema of the peripheral select pins is not limited to a small range of fixed peripheral configurations. There are no mutual or hardware-enforced lockouts between any of the peripheral mapping SFRs. Literally any combination of peripheral mappings across any or all of the RPn pins is possible. This includes both many-to-one and one-to-many mappings of peripheral inputs and outputs to pins. While such mappings may be technically possible from a configuration point of view, they may not be supportable from an electrical point of view.

TABLE 11-3: OUTPUT SELECTION FOR REMAPPABLE PINS (RPn)

| Function | RPxR[5:0] | Output Name |
|------------------------|-----------|---|
| Default PORT | 000000 | RPn tied to Default Pin |
| U1TX | 000001 | RPn tied to UART1 Transmit |
| U2TX | 000011 | RPn tied to UART2 Transmit |
| SDO2 | 001000 | RPn tied to SPI2 Data Output |
| SCK2 | 001001 | RPn tied to SPI2 Clock Output |
| SS2 | 001010 | RPn tied to SPI2 Slave Select |
| C1TX ⁽²⁾ | 001110 | RPn tied to CAN1 Transmit |
| OC1 | 010000 | RPn tied to Output Compare 1 Output |
| OC2 | 010001 | RPn tied to Output Compare 2 Output |
| OC3 | 010010 | RPn tied to Output Compare 3 Output |
| OC4 | 010011 | RPn tied to Output Compare 4 Output |
| C1OUT | 011000 | RPn tied to Comparator Output 1 |
| C2OUT | 011001 | RPn tied to Comparator Output 2 |
| C3OUT | 011010 | RPn tied to Comparator Output 3 |
| SYNCO1 ⁽¹⁾ | 101101 | RPn tied to PWM Primary Time Base Sync Output |
| QE1CCMP ⁽¹⁾ | 101111 | RPn tied to QE1 Counter Comparator Output |
| REFCLKO | 110001 | RPn tied to Reference Clock Output |
| C4OUT | 110010 | RPn tied to Comparator Output 4 |

Note 1: This function is available in dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices only.

2: This function is available in dsPIC33EPXXXGP/MC50X devices only.

11.5 I/O Helpful Tips

1. In some cases, certain pins, as defined in [Table 30-11](#), under “Injection Current”, have internal protection diodes to VDD and VSS. The term, “Injection Current”, is also referred to as “Clamp Current”. On designated pins, with sufficient external current-limiting precautions by the user, I/O pin input voltages are allowed to be greater or less than the data sheet absolute maximum ratings, with respect to the VSS and VDD supplies. Note that when the user application forward biases either of the high or low side internal input clamp diodes, that the resulting current being injected into the device, that is clamped internally by the VDD and VSS power rails, may affect the ADC accuracy by four to six counts.
2. I/O pins that are shared with any analog input pin (i.e., ANx) are always analog pins by default after any Reset. Consequently, configuring a pin as an analog input pin automatically disables the digital input pin buffer and any attempt to read the digital input level by reading PORTx or LATx will always return a ‘0’, regardless of the digital logic level on the pin. To use a pin as a digital I/O pin on a shared ANx pin, the user application needs to configure the Analog Pin Configuration registers in the I/O ports module (i.e., ANSELx) by setting the appropriate bit that corresponds to that I/O port pin to a ‘0’.

Note: Although it is not possible to use a digital input pin when its analog function is enabled, it is possible to use the digital I/O output function, TRISx = 0x0, while the analog function is also enabled. However, this is not recommended, particularly if the analog input is connected to an external analog voltage source, which would create signal contention between the analog signal and the output pin driver.

3. Most I/O pins have multiple functions. Referring to the device pin diagrams in this data sheet, the priorities of the functions allocated to any pins are indicated by reading the pin name from left-to-right. The left most function name takes precedence over any function to its right in the naming convention. For example: AN16/T2CK/T7CK/RC1. This indicates that AN16 is the highest priority in this example and will supersede all other functions to its right in the list. Those other functions to its right, even if enabled, would not work as long as any other function to its left was enabled. This rule applies to all of the functions listed for a given pin.
4. Each pin has an internal weak pull-up resistor and pull-down resistor that can be configured using the CNPUs and CNPDx registers, respectively. These resistors eliminate the need for external resistors in certain applications. The internal pull-up is up to $\sim(VDD - 0.8)$, not VDD. This value is still above the minimum V_{IH} of CMOS and TTL devices.
5. When driving LEDs directly, the I/O pin can source or sink more current than what is specified in the V_{OH}/I_{OH} and V_{OL}/I_{OL} DC characteristic specification. The respective I_{OH} and I_{OL} current rating only applies to maintaining the corresponding output at or above the V_{OH} , and at or below the V_{OL} levels. However, for LEDs, unlike digital inputs of an externally connected device, they are not governed by the same minimum V_{IH}/V_{IL} levels. An I/O pin output can safely sink or source any current less than that listed in the absolute maximum rating section of this data sheet. For example:
 $V_{OH} = 2.4V @ I_{OH} = -8 \text{ mA}$ and $V_{DD} = 3.3V$
 The maximum output current sourced by any 8 mA I/O pin = 12 mA.
 LED source current < 12 mA is technically permitted. Refer to the V_{OH}/I_{OH} graphs in [Section 30.0 “Electrical Characteristics”](#) for additional information.
6. The Peripheral Pin Select (PPS) pin mapping rules are as follows:
 - a) Only one “output” function can be active on a given pin at any time, regardless if it is a dedicated or remappable function (one pin, one output).
 - b) It is possible to assign a “remappable output” function to multiple pins and externally short or tie them together for increased current drive.
 - c) If any “dedicated output” function is enabled on a pin, it will take precedence over any remappable “output” function.
 - d) If any “dedicated digital” (input or output) function is enabled on a pin, any number of “input” remappable functions can be mapped to the same pin.
 - e) If any “dedicated analog” function(s) are enabled on a given pin, “digital input(s)” of any kind will all be disabled, although a single “digital output”, at the user’s cautionary discretion, can be enabled and active as long as there is no signal contention with an external analog input signal. For example, it is possible for the ADC to convert the digital output logic level, or to toggle a digital output on a comparator or ADC input provided there is no external analog input, such as for a built-in self-test.
 - f) Any number of “input” remappable functions can be mapped to the same pin(s) at the same time, including to any pin with a single output from either a dedicated or remappable “output”.

- g) The TRISx registers control *only* the digital I/O output buffer. Any other dedicated or remappable active “output” will automatically override the TRIS setting. The TRISx register *does not* control the digital logic “input” buffer. Remappable digital “inputs” do not automatically override TRIS settings, which means that the TRISx bit must be set to input for pins with only remappable input function(s) assigned
- h) All analog pins are enabled by default after any Reset and the corresponding digital input buffer on the pin has been disabled. Only the Analog Pin Select registers control the digital input buffer, *not* the TRISx register. The user must disable the analog function on a pin using the Analog Pin Select registers in order to use any “digital input(s)” on a corresponding pin, no exceptions.

11.6 I/O Ports Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

NOTES:

12.0 TIMER1

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Timers” (www.microchip.com/DS70362) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The Timer1 module is a 16-bit timer that can operate as a free-running interval timer/counter.

The Timer1 module has the following unique features over other timers:

- Can be Operated in Asynchronous Counter mode from an External Clock Source
- The External Clock Input (T1CK) can Optionally be Synchronized to the Internal Device Clock and the Clock Synchronization is Performed after the Prescaler

A block diagram of Timer1 is shown in [Figure 12-1](#).

The Timer1 module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode
- Asynchronous Counter mode

In Timer and Gated Timer modes, the input clock is derived from the internal instruction cycle clock (Fcy). In Synchronous and Asynchronous Counter modes, the input clock is derived from the external clock input at the T1CK pin.

The Timer modes are determined by the following bits:

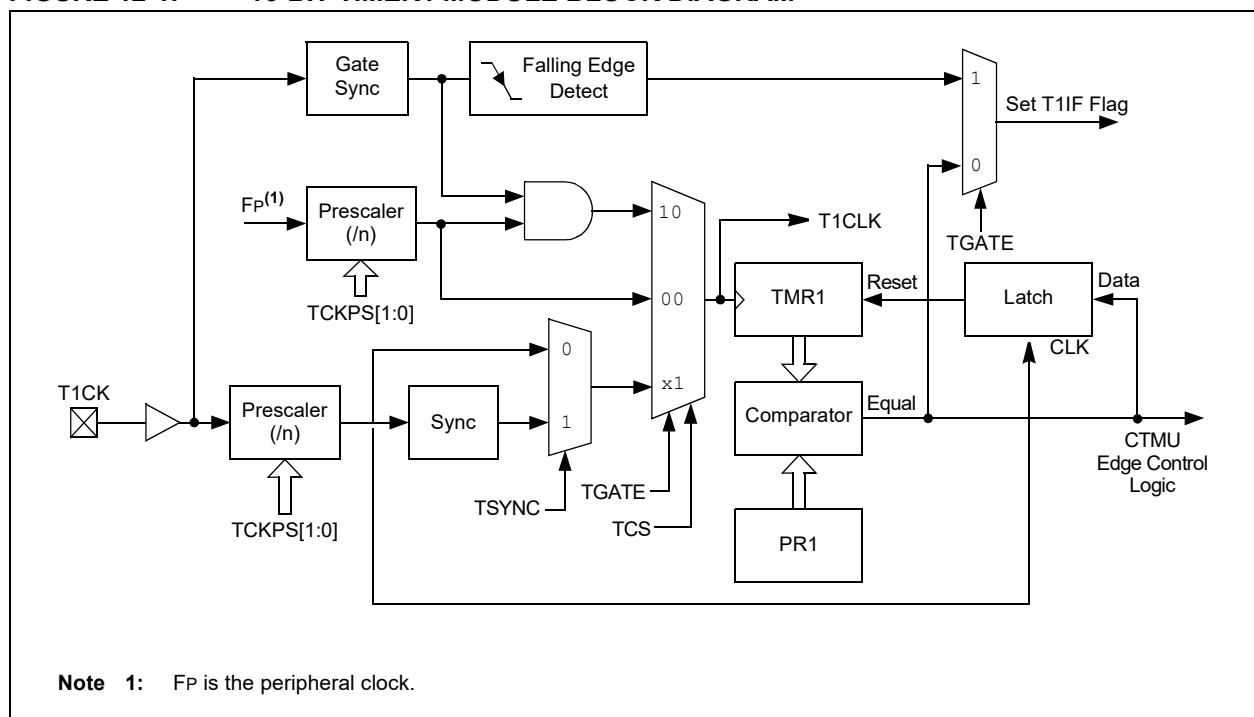

- Timer Clock Source Control bit (TCS): T1CON[1]
- Timer Synchronization Control bit (TSYNC): T1CON[2]
- Timer Gate Control bit (TGATE): T1CON[6]

Timer control bit setting for different operating modes are given in the [Table 12-1](#).

TABLE 12-1: TIMER MODE SETTINGS

| Mode | TCS | TGATE | TSYNC |
|----------------------|-----|-------|-------|
| Timer | 0 | 0 | x |
| Gated Timer | 0 | 1 | x |
| Synchronous Counter | 1 | x | 1 |
| Asynchronous Counter | 1 | x | 0 |

 00 = 1:1
- bit 3 **Unimplemented:** Read as '0'
- bit 2 **TSYNC:** Timer1 External Clock Input Synchronization Select bit⁽¹⁾
When TCS = 1:
 1 = Synchronizes external clock input
 0 = Does not synchronize external clock input
When TCS = 0:
 This bit is ignored.
- bit 1 **TCS:** Timer1 Clock Source Select bit⁽¹⁾
 1 = External clock is from pin, T1CK (on the rising edge)
 0 = Internal clock (Fp)
- bit 0 **Unimplemented:** Read as '0'

Note 1: When Timer1 is enabled in External Synchronous Counter mode (TCS = 1, TSYNC = 1, TON = 1), any attempts by user software to write to the TMR1 register are ignored.

NOTES:

13.0 TIMER2/3 AND TIMER4/5

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Timers” (www.microchip.com/DS70362) of the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The Timer2/3 and Timer4/5 modules are 32-bit timers, which can also be configured as four independent 16-bit timers with selectable operating modes.

As 32-bit timers, Timer2/3 and Timer4/5 operate in three modes:

- Two Independent 16-Bit Timers (e.g., Timer2 and Timer3) with all 16-Bit Operating modes (except Asynchronous Counter mode)
- Single 32-Bit Timer
- Single 32-Bit Synchronous Counter

They also support these features:

- Timer Gate Operation
- Selectable Prescaler Settings
- Timer Operation during Idle and Sleep modes
- Interrupt on a 32-Bit Period Register Match
- Time Base for Input Capture and Output Compare Modules (Timer2 and Timer3 only)
- ADC1 Event Trigger (32-bit timer pairs, and Timer3 and Timer5 only)

Individually, all four of the 16-bit timers can function as synchronous timers or counters. They also offer the features listed previously, except for the event trigger; this is implemented only with Timer2/3. The operating modes and enabled features are determined by setting the appropriate bit(s) in the T2CON, T3CON, and T4CON, T5CON registers. T2CON and T4CON are shown in generic form in [Register 13-1](#). T3CON and T5CON are shown in [Register 13-2](#).

For 32-bit timer/counter operation, Timer2 and Timer4 are the least significant word (lsw); Timer3 and Timer5 are the most significant word (msw) of the 32-bit timers.

Note: For 32-bit operation, T3CON and T5CON control bits are ignored. Only T2CON and T4CON control bits are used for setup and control. Timer2 and Timer4 clock and gate inputs are utilized for the 32-bit timer modules, but an interrupt is generated with the Timer3 and Timer5 interrupt flags.

A block diagram for an example 32-bit timer pair (Timer2/3 and Timer4/5) is shown in [Figure 13-3](#).

Note: Only Timer2, 3, 4 and 5 can trigger a DMA data transfer.

FIGURE 13-1: TYPE B TIMER BLOCK DIAGRAM (x = 2 AND 4)

- bit 0 **Unimplemented:** Read as '0'

Note 1: When 32-bit operation is enabled (T2CON[3] = 1), these bits have no effect on Timery operation; all timer functions are set through TxCON.

2: When 32-bit timer operation is enabled (T32 = 1) in the Timerx Control register (TxCON[3]), the TSIDL bit must be cleared to operate the 32-bit timer in Idle mode.

3: The TyCK pin is not available on all devices. See the “[Pin Diagrams](#)” section for the available pins.

NOTES:

14.0 INPUT CAPTURE

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Input Capture with Dedicated Timer**” (www.microchip.com/DS70000352) in the “dsPIC33/dsPIC24 Family Reference Manual”.

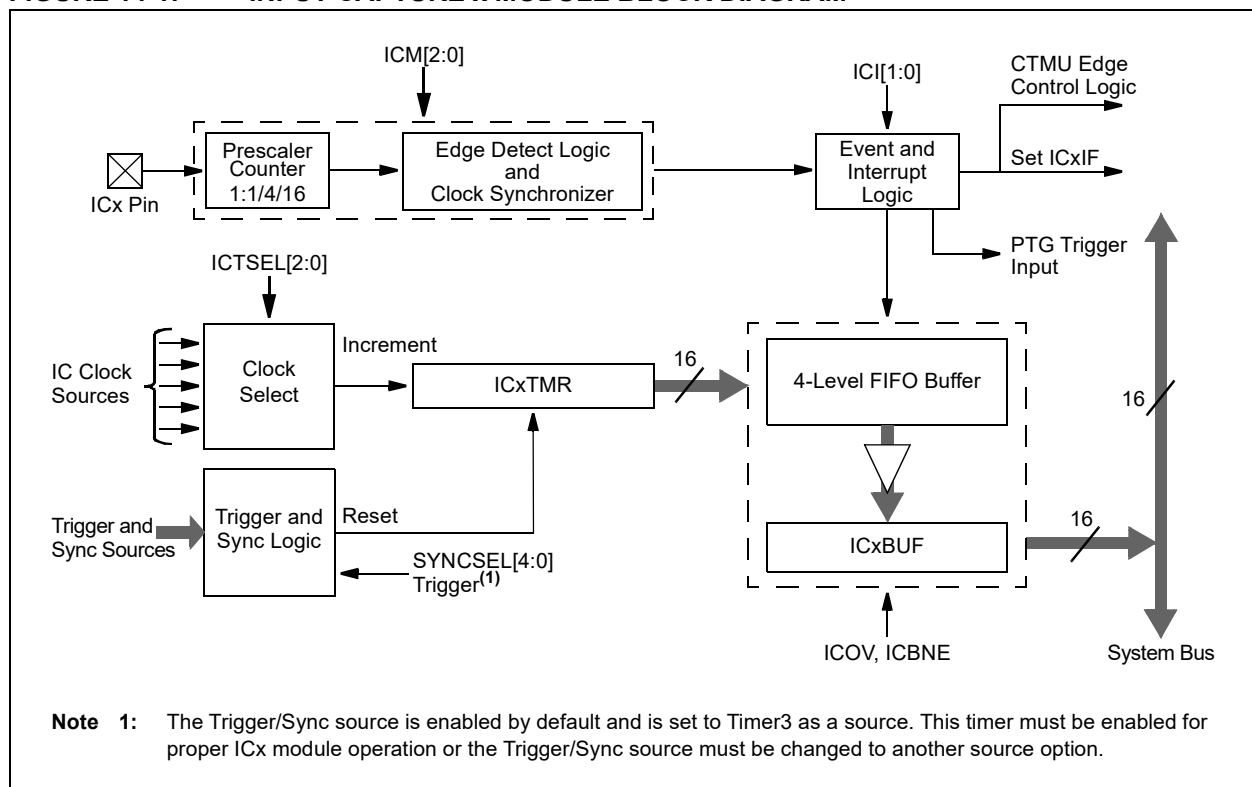

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The input capture module is useful in applications requiring frequency (period) and pulse measurement. The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices support four input capture channels.

Key features of the input capture module include:

- Hardware-configurable for 32-bit operation in all modes by cascading two adjacent modules
- Synchronous and Trigger modes of output compare operation, with up to 19 user-selectable Trigger/Sync sources available
- A 4-level FIFO buffer for capturing and holding timer values for several events
- Configurable interrupt generation
- Up to six clock sources available for each module, driving a separate internal 16-bit counter

FIGURE 14-1: INPUT CAPTURE x MODULE BLOCK DIAGRAM

NOTES:

15.0 OUTPUT COMPARE

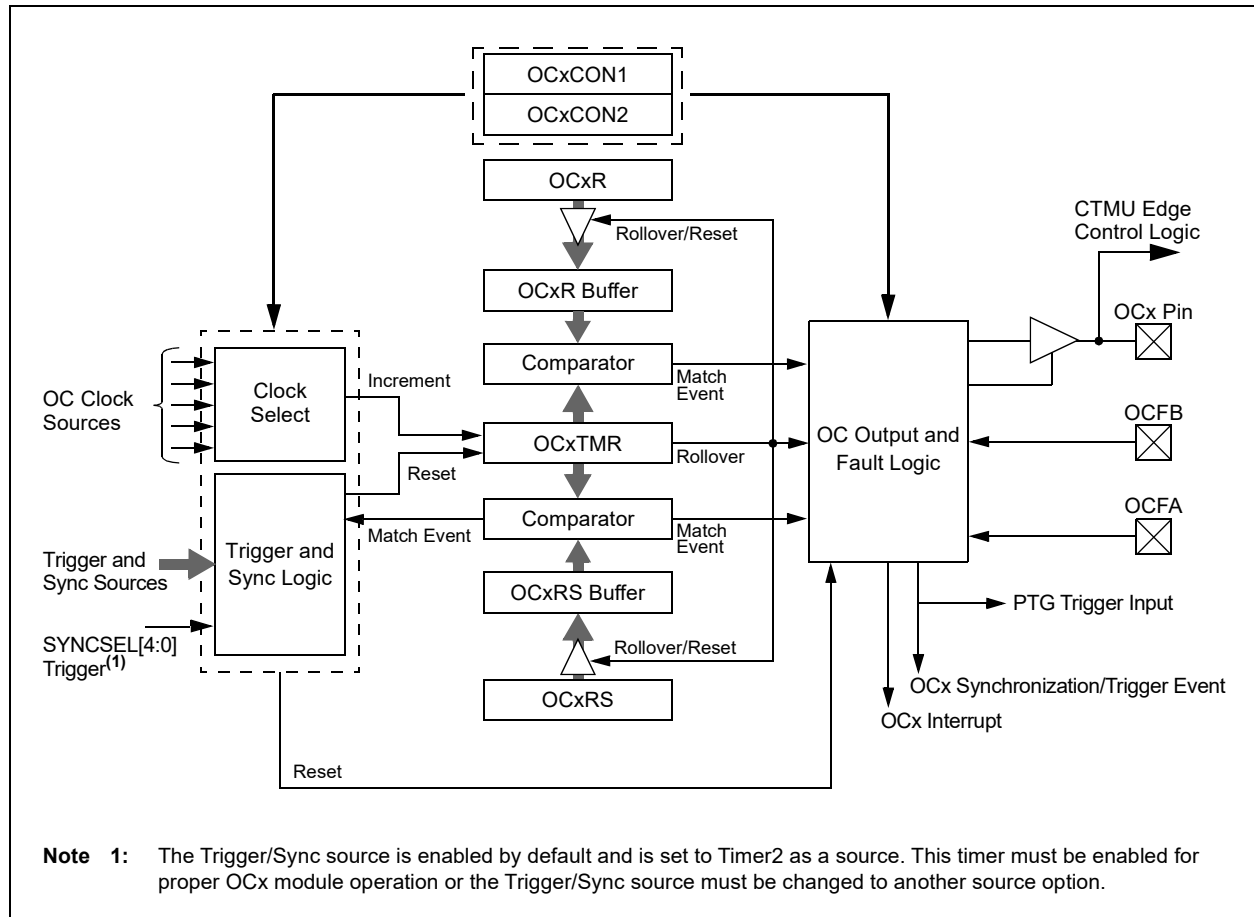

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Output Compare**” (www.microchip.com/DS70000358) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The output compare module can select one of seven available clock sources for its time base. The module compares the value of the timer with the value of one or two compare registers depending on the operating mode selected. The state of the output pin changes when the timer value matches the compare register value. The output compare module generates either a single output pulse or a sequence of output pulses, by changing the state of the output pin on the compare match events. The output compare module can also generate interrupts on compare match events and trigger DMA data transfers.

Note: Refer to “**Output Compare**” (www.microchip.com/DS70000358) in the “dsPIC33/PIC24 Family Reference Manual” for OCxR and OCxRS register restrictions.

PTGO1 = OC2
PTGO2 = OC3
PTGO3 = OC4

16.0 HIGH-SPEED PWM MODULE (dsPIC33EPXXXMC20X/50X AND PIC24EPXXXMC20X DEVICES ONLY)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**High-Speed PWM**” (www.microchip.com/DS70645) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices support a dedicated Pulse-Width Modulation (PWM) module with up to six outputs.

The high-speed PWMx module consists of the following major features:

- Three PWM Generators
- Two PWM Outputs per PWM Generator
- Individual Period and Duty Cycle for Each PWM Pair
- Duty Cycle, Dead Time, Phase Shift and Frequency Resolution of $T_{CY}/2$ (7.14 ns at $F_{CY} = 70$ MHz)
- Independent Fault and Current-Limit Inputs for Six PWM Outputs
- Redundant Output
- Center-Aligned PWM mode
- Output Override Control
- Chop mode (also known as Gated mode)
- Special Event Trigger
- Prescaler for Input Clock
- PWMxL and PWMxH Output Pin Swapping
- Independent PWM Frequency, Duty Cycle and Phase-Shift Changes for Each PWM Generator
- Dead-Time Compensation
- Enhanced Leading-Edge Blanking (LEB) Functionality
- Frequency Resolution Enhancement
- PWM Capture Functionality

Note: In Edge-Aligned PWM mode, the duty cycle, dead time, phase shift and frequency resolution are 7.14 ns.

The high-speed PWMx module contains up to three PWM generators. Each PWM generator provides two PWM outputs: PWMxH and PWMxL. The master time base generator provides a synchronous signal as a common time base to synchronize the various PWM outputs. The individual PWM outputs are available on the output pins of the device. The input Fault signals and current-limit signals, when enabled, can monitor and protect the system by placing the PWM outputs into a known “safe” state.

Each PWMx can generate a trigger to the ADC module to sample the analog signal at a specific instance during the PWM period. In addition, the high-speed PWMx module also generates a Special Event Trigger to the ADC module based on either of the two master time bases.

The high-speed PWMx module can synchronize itself with an external signal or can act as a synchronizing source to any external device. The SYNC1 input pin that utilizes PPS, can synchronize the high-speed PWMx module with an external signal. The SYNC0 pin is an output pin that provides a synchronous signal to an external device.

Figure 16-1 illustrates an architectural overview of the high-speed PWMx module and its interconnection with the CPU and other peripherals.

16.1 PWM Faults

The PWMx module incorporates multiple external Fault inputs to include FLT1 and FLT2 which are remappable using the PPS feature, FLT3 and FLT4 which are available only on the larger 44-pin and 64-pin packages, and FLT32 which has been implemented with Class B safety features, and is available on a fixed pin on all dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices.

These Faults provide a safe and reliable way to safely shut down the PWM outputs when the Fault input is asserted.

16.1.1 PWM FAULTS AT RESET

During any Reset event, the PWMx module maintains ownership of the Class B Fault, FLT32. At Reset, this Fault is enabled in Latched mode to ensure the fail-safe power-up of the application. The application software must clear the PWM Fault before enabling the high-speed motor control PWMx module. To clear the Fault condition, the FLT32 pin must first be pulled low externally or the internal pull-down resistor in the CNPDx register can be enabled.

Note: The Fault mode may be changed using the FLTMOD[1:0] bits (FCLCON[1:0]), regardless of the state of FLT32.

16.1.2 WRITE-PROTECTED REGISTERS

On dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices, write protection is implemented for the IOCONx and FCLCONx registers. The write protection feature prevents any inadvertent writes to these registers. This protection feature can be controlled by the PWMLOCK Configuration bit (FOSCSEL[6]). The default state of the write protection feature is enabled (PWMLOCK = 1). The write protection feature can be disabled by configuring, PWMLOCK = 0.

To gain write access to these locked registers, the user application must write two consecutive values of (0xABCD and 0x4321) to the PWMKEY register to perform the unlock operation. The write access to the IOCONx or FCLCONx registers must be the next SFR access following the unlock process. There can be no other SFR accesses during the unlock process and subsequent write access. To write to both the IOCONx and FCLCONx registers requires two unlock operations.

The correct unlocking sequence is described in [Example 16-1](#).

EXAMPLE 16-1: PWMx WRITE-PROTECTED REGISTER UNLOCK SEQUENCE

```
; FLT32 pin must be pulled low externally in order to clear and disable the fault
; Writing to FCLCON1 register requires unlock sequence

mov #0xabcd,w10      ; Load first unlock key to w10 register
mov #0x4321,w11      ; Load second unlock key to w11 register
mov #0x0000,w0       ; Load desired value of FCLCON1 register in w0
mov w10, PWMKEY      ; Write first unlock key to PWMKEY register
mov w11, PWMKEY      ; Write second unlock key to PWMKEY register
mov w0,FCLCON1       ; Write desired value to FCLCON1 register

; Set PWM ownership and polarity using the IOCON1 register
; Writing to IOCON1 register requires unlock sequence

mov #0xabcd,w10      ; Load first unlock key to w10 register
mov #0x4321,w11      ; Load second unlock key to w11 register
mov #0xF000,w0       ; Load desired value of IOCON1 register in w0
mov w10, PWMKEY      ; Write first unlock key to PWMKEY register
mov w11, PWMKEY      ; Write second unlock key to PWMKEY register
mov w0,IOCON1        ; Write desired value to IOCON1 register
```

NOTES:

17.0 QUADRATURE ENCODER INTERFACE (QEI) MODULE (dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X DEVICES ONLY)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Quadrature Encoder Interface (QEI)**” (www.microchip.com/DS70000601) in the “*dsPIC33/PIC24 Family Reference Manual*”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

This chapter describes the Quadrature Encoder Interface (QEI) module and associated operational modes. The QEI module provides the interface to incremental encoders for obtaining mechanical position data.

The operational features of the QEI module include:

- 32-Bit Position Counter
- 32-Bit Index Pulse Counter
- 32-Bit Interval Timer
- 16-Bit Velocity Counter
- 32-Bit Position Initialization/Capture/Compare High register
- 32-Bit Position Compare Low register
- x4 Quadrature Count mode
- External Up/Down Count mode
- External Gated Count mode
- External Gated Timer mode
- Internal Timer mode

[Figure 17-1](#) illustrates the QEI block diagram.

FIGURE 17-1: QE1 BLOCK DIAGRAM

17.1 QEI Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

bit 7 **Unimplemented:** Read as '0'

Note 1: When CCM[1:0] = 10 or 11, all of the QE1 counters operate as timers and the PIMOD[2:0] bits are ignored.

Note 2: When CCM[1:0] = 00, and QEA and QEB values match the Index Match Value (IMV), the POSCNTNTH and POSCNTL registers are reset. QEA/QEB signals used for the index match have swap and polarity values applied, as determined by the SWPAB and QEAPOL/QEBPOL bits.

Note 3: The selected clock rate should be at least twice the expected maximum quadrature count rate.

18.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Serial Peripheral Interface (SPI)**” (www.microchip.com/DS70005185) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The SPI module is a synchronous serial interface, useful for communicating with other peripheral or microcontroller devices. These peripheral devices can be serial EEPROMs, shift registers, display drivers, ADC Converters, etc. The SPI module is compatible with Motorola® SPI and SIOP interfaces.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X device family offers two SPI modules on a single device. These modules, which are designated as SPI1 and SPI2, are functionally identical. Each SPI module includes an eight-word FIFO buffer and allows DMA bus connections. When using the SPI module with DMA, FIFO operation can be disabled.

Note: In this section, the SPI modules are referred to together as SPIx, or separately as SPI1 and SPI2. Special Function Registers follow a similar notation. For example, SPIxCON refers to the control register for the SPI1 and SPI2 modules.

The SPI1 module uses dedicated pins which allow for a higher speed when using SPI1. The SPI2 module takes advantage of the Peripheral Pin Select (PPS) feature to allow for greater flexibility in pin configuration of the SPI2 module, but results in a lower maximum speed for SPI2. See [Section 30.0 “Electrical Characteristics”](#) for more information.

The SPIx serial interface consists of four pins, as follows:

- SDIx: Serial Data Input
- SDOx: Serial Data Output
- SCKx: Shift Clock Input or Output
- SSx/FSYNCx: Active-Low Slave Select or Frame Synchronization I/O Pulse

The SPIx module can be configured to operate with two, three or four pins. In 3-pin mode, SSx is not used. In 2-pin mode, neither SDOx nor SSx is used.

[Figure 18-1](#) illustrates the block diagram of the SPIx module in Standard and Enhanced modes.

Note 1: In Standard mode, the FIFO is only one level deep.

18.1 SPI Helpful Tips

1. In Frame mode, if there is a possibility that the master may not be initialized before the slave:
 - a) If FRMPOL (SPIxCON2[13]) = 1, use a pull-down resistor on \overline{SSx} .
 - b) If FRMPOL = 0, use a pull-up resistor on \overline{SSx} .

Note: This insures that the first frame transmission after initialization is not shifted or corrupted.

2. In Non-Framed Three-Wire mode, (i.e., not using \overline{SSx} from a master):
 - a) If CKP (SPIxCON1[6]) = 1, always place a pull-up resistor on \overline{SSx} .
 - b) If CKP = 0, always place a pull-down resistor on \overline{SSx} .

Note: This will insure that during power-up and initialization the master/slave will not lose Sync due to an errant SCKx transition that would cause the slave to accumulate data shift errors for both transmit and receive appearing as corrupted data.

3. FRMEN (SPIxCON2[15]) = 1 and SSEN (SPIxCON1[7]) = 1 are exclusive and invalid. In Frame mode, SCKx is continuous and the Frame Sync pulse is active on the \overline{SSx} pin, which indicates the start of a data frame.

Note: Not all third-party devices support Frame mode timing. Refer to the SPIx specifications in [Section 30.0 “Electrical Characteristics”](#) for details.

4. In Master mode only, set the SMP bit (SPIxCON1[9]) to a ‘1’ for the fastest SPIx data rate possible. The SMP bit can only be set at the same time or after the MSTEN bit (SPIxCON1[5]) is set.

To avoid invalid slave read data to the master, the user’s master software must ensure enough time for slave software to fill its write buffer before the user application initiates a master write/read cycle. It is always advisable to preload the SPIxBUF Transmit register in advance of the next master transaction cycle. SPIxBUF is transferred to the SPIx Shift register and is empty once the data transmission begins.

18.2 SPI Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

- bit 15 **SPIEN:** SPIx Enable bit
1 = Enables the module and configures SCKx, SDOx, SDIx and \overline{SSx} as serial port pins
0 = Disables the module
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **SPISIDL:** SPIx Stop in Idle Mode bit
1 = Discontinues the module operation when device enters Idle mode
0 = Continues the module operation in Idle mode
- bit 12-11 **Unimplemented:** Read as '0'
- bit 10-8 **SPIBEC[2:0]:** SPIx Buffer Element Count bits (valid in Enhanced Buffer mode)
Master mode:
Number of SPIx transfers that are pending.
Slave mode:
Number of SPIx transfers that are unread.
- bit 7 **SRMPT:** SPIx Shift Register (SPIxSR) Empty bit (valid in Enhanced Buffer mode)
1 = SPIx Shift register is empty and Ready-to-Send or receive the data
0 = SPIx Shift register is not empty
- bit 6 **SPIROV:** SPIx Receive Overflow Flag bit
1 = A new byte/word is completely received and discarded; the user application has not read the previous data in the SPIxBUF register
0 = No overflow has occurred
- bit 5 **SRXMPT:** SPIx Receive FIFO Empty bit (valid in Enhanced Buffer mode)
1 = RX FIFO is empty
0 = RX FIFO is not empty
- bit 4-2 **SISEL[2:0]:** SPIx Buffer Interrupt Mode bits (valid in Enhanced Buffer mode)
111 = Interrupt when the SPIx transmit buffer is full (SPITBF bit is set)
110 = Interrupt when last bit is shifted into SPIxSR and as a result, the TX FIFO is empty
101 = Interrupt when the last bit is shifted out of SPIxSR and the transmit is complete
100 = Interrupt when one data are shifted into the SPIxSR and as a result, the TX FIFO has one open memory location
011 = Interrupt when the SPIx receive buffer is full (SPIRBF bit is set)
010 = Interrupt when the SPIx receive buffer is 3/4 or more full
001 = Interrupt when data are available in the receive buffer (SRMPT bit is set)
000 = Interrupt when the last data in the receive buffer are read and as a result, the buffer is empty (SRXMPT bit is set)

REGISTER 18-1: SPIxSTAT: SPIx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 1 **SPITBF:** SPIx Transmit Buffer Full Status bit
1 = Transmit not yet started, SPIxTXB is full
0 = Transmit started, SPIxTXB is empty
Standard Buffer mode:
Automatically set in hardware when core writes to the SPIxBUF location, loading SPIxTXB. Automatically cleared in hardware when SPIx module transfers data from SPIxTXB to SPIxSR.
Enhanced Buffer mode:
Automatically set in hardware when the CPU writes to the SPIxBUF location, loading the last available buffer location. Automatically cleared in hardware when a buffer location is available for a CPU write operation.
- bit 0 **SPIRBF:** SPIx Receive Buffer Full Status bit
1 = Receive is complete, SPIxRXB is full
0 = Receive is incomplete, SPIxRXB is empty
Standard Buffer mode:
Automatically set in hardware when SPIx transfers data from SPIxSR to SPIxRXB. Automatically cleared in hardware when the core reads the SPIxBUF location, reading SPIxRXB.
Enhanced Buffer mode:
Automatically set in hardware when SPIx transfers data from SPIxSR to the buffer, filling the last unread buffer location. Automatically cleared in hardware when a buffer location is available for a transfer from SPIxSR.

0 = Enhanced buffer is disabled (Standard mode)

19.0 INTER-INTEGRATED CIRCUIT (I²C)

- Note 1:** This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Inter-Integrated Circuit (I²C)**” (www.microchip.com/DS70000195) in the “*dsPIC33/PIC24 Family Reference Manual*”.
- 2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.
- 3:** There are minimum bit rates of approximately $F_{CY}/512$. As a result, high processor speeds may not support 100 Kbit/second operation. See timing specifications, IM10 and IM11, and the “**Baud Rate Generator**” in the “*dsPIC33/PIC24 Family Reference Manual*”.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X family of devices contains two Inter-Integrated Circuit (I²C) modules: I2C1 and I2C2.

The I²C module provides complete hardware support for both Slave and Multi-Master modes of the I²C serial communication standard, with a 16-bit interface.

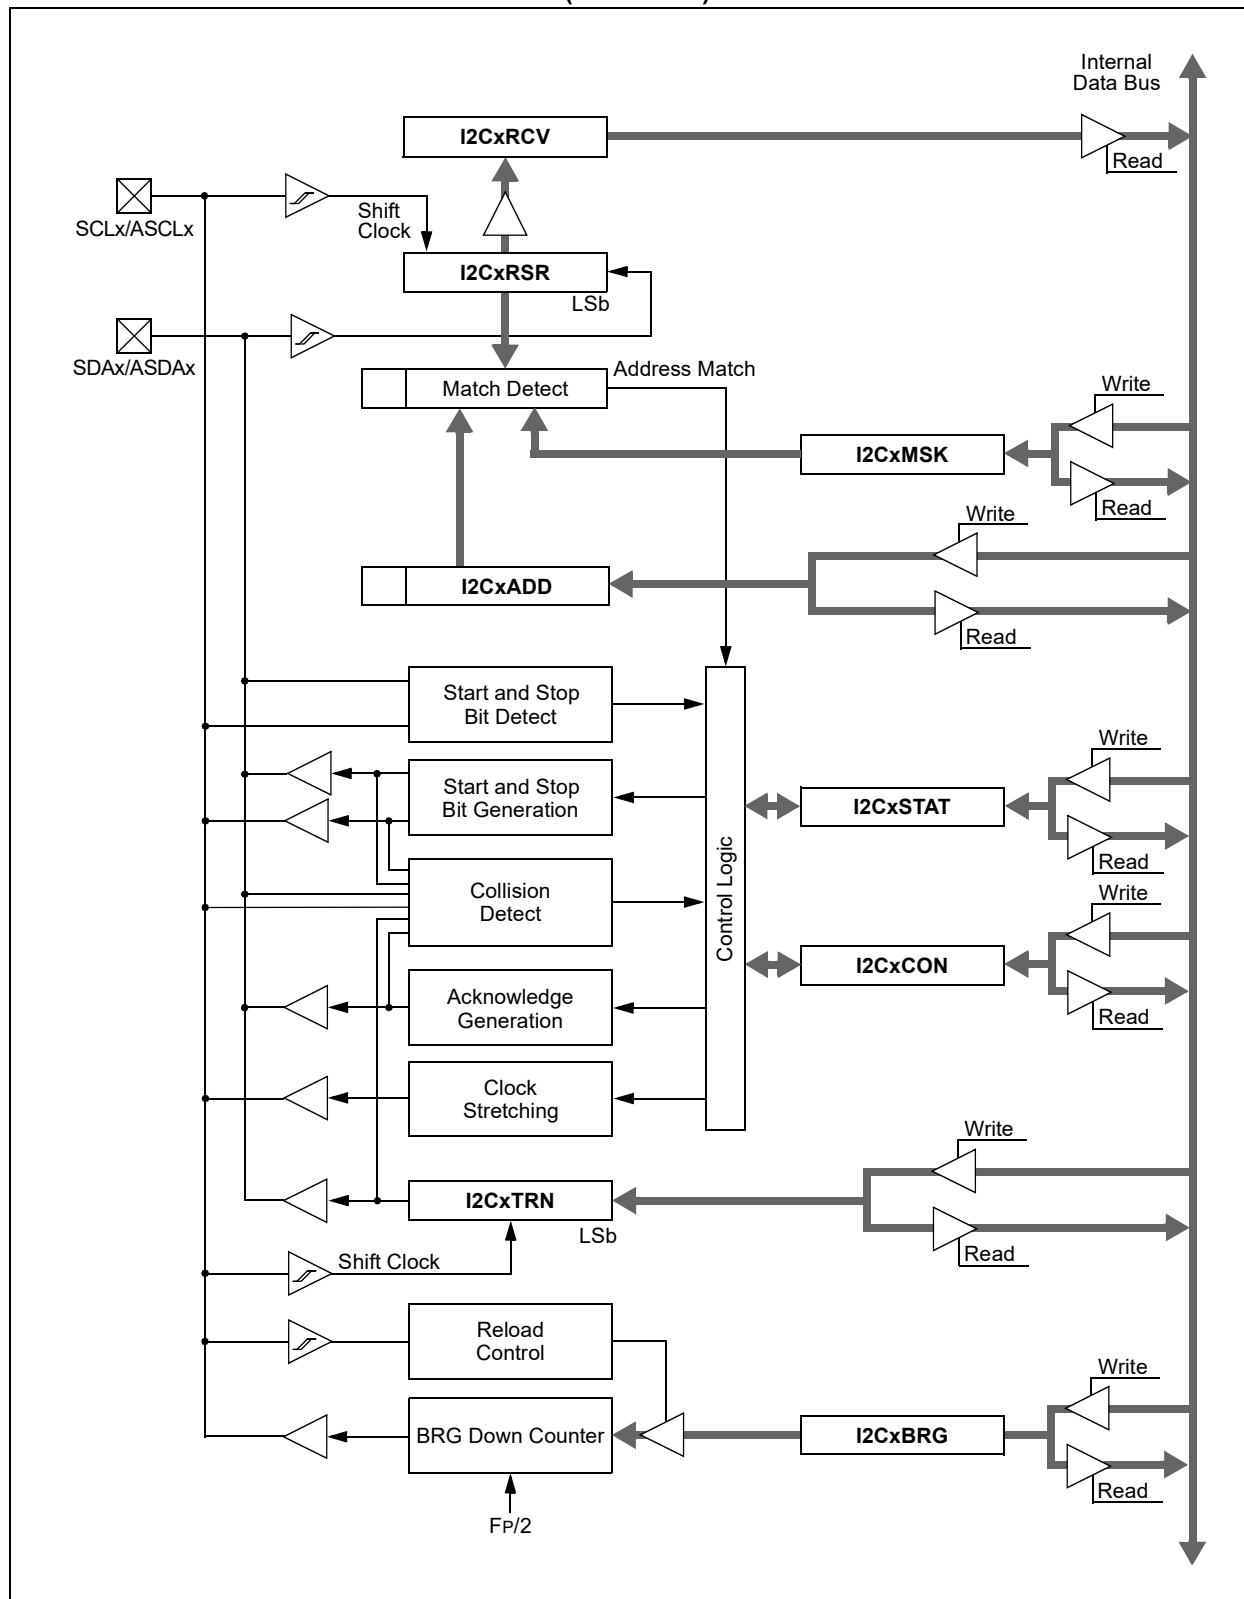

The I²C module has a 2-pin interface:

- The SCLx pin is clock
- The SDAx pin is data

The I²C module offers the following key features:

- I²C Interface Supporting both Master and Slave modes of Operation
- I²C Slave mode Supports 7 and 10-Bit Addressing
- I²C Master mode Supports 7 and 10-Bit Addressing
- I²C Port allows Bidirectional Transfers between Master and Slaves
- Serial Clock Synchronization for I²C Port can be used as a Handshake Mechanism to Suspend and Resume Serial Transfer (SCLREL control)
- I²C Supports Multi-Master Operation, Detects Bus Collision and Arbitrates Accordingly
- Intelligent Platform Management Interface (IPMI) Support
- System Management Bus (SMBus) Support

- bit 15 **I2CEN:** I2Cx Enable bit
 1 = Enables the I2Cx module and configures the SDAx and SCLx pins as serial port pins
 0 = Disables the I2Cx module; all I²C pins are controlled by port functions
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **I2CSIDL:** I2Cx Stop in Idle Mode bit
 1 = Discontinues module operation when device enters an Idle mode
 0 = Continues module operation in Idle mode
- bit 12 **SCLREL:** SCLx Release Control bit (when operating as I²C slave)
 1 = Releases SCLx clock
 0 = Holds SCLx clock low (clock stretch)
If STREN = 1:
 Bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware is clear at the beginning of every slave data byte transmission. Hardware is clear at the end of every slave address byte reception. Hardware is clear at the end of every slave data byte reception.
If STREN = 0:
 Bit is R/S (i.e., software can only write '1' to release clock). Hardware is clear at the beginning of every slave data byte transmission. Hardware is clear at the end of every slave address byte reception.
- bit 11 **IPMIEN:** Intelligent Peripheral Management Interface (IPMI) Enable bit⁽¹⁾
 1 = IPMI mode is enabled; all addresses are Acknowledged
 0 = IPMI mode disabled
- bit 10 **A10M:** 10-Bit Slave Address bit
 1 = I2CxADD is a 10-bit slave address
 0 = I2CxADD is a 7-bit slave address
- bit 9 **DISSLW:** Disable Slew Rate Control bit
 1 = Slew rate control is disabled
 0 = Slew rate control is enabled
- bit 8 **SMEN:** SMBus Input Levels bit
 1 = Enables I/O pin thresholds compliant with SMBus specification
 0 = Disables SMBus input thresholds
- bit 7 **GCEN:** General Call Enable bit (when operating as I²C slave)
 1 = Enables interrupt when a general call address is received in I2CxRSR (module is enabled for reception)
 0 = General call address disabled

Note 1: When performing master operations, ensure that the IPMIEN bit is set to '0'.

- bit 15 **ACKSTAT:** Acknowledge Status bit (when operating as I²C master, applicable to master transmit operation)
1 = NACK received from slave
0 = ACK received from slave
Hardware is set or clear at the end of slave Acknowledge.
- bit 14 **TRSTAT:** Transmit Status bit (when operating as I²C master, applicable to master transmit operation)
1 = Master transmit is in progress (8 bits + ACK)
0 = Master transmit is not in progress
Hardware is set at the beginning of master transmission. Hardware is clear at the end of slave Acknowledge.
- bit 13-11 **Unimplemented:** Read as '0'
- bit 10 **BCL:** Master Bus Collision Detect bit
1 = A bus collision has been detected during a master operation
0 = No bus collision detected
Hardware is set at detection of a bus collision.
- bit 9 **GCSTAT:** General Call Status bit
1 = General call address was received
0 = General call address was not received
Hardware is set when address matches general call address. Hardware is clear at Stop detection.
- bit 8 **ADD10:** 10-Bit Address Status bit
1 = 10-bit address was matched
0 = 10-bit address was not matched
Hardware is set at the match of the 2nd byte of the matched 10-bit address. Hardware is clear at Stop detection.
- bit 7 **IWCOL:** I2Cx Write Collision Detect bit
1 = An attempt to write to the I2CxTRN register failed because the I²C module is busy
0 = No collision
Hardware is set at the occurrence of a write to I2CxTRN while busy (cleared by software).
- bit 6 **I2COV:** I2Cx Receive Overflow Flag bit
1 = A byte was received while the I2CxRCV register was still holding the previous byte
0 = No overflow
Hardware is set at an attempt to transfer I2CxRSR to I2CxRCV (cleared by software).
- bit 5 **D_A:** Data/Address bit (when operating as I²C slave)
1 = Indicates that the last byte received was data
0 = Indicates that the last byte received was a device address
Hardware is clear at a device address match. Hardware is set by reception of a slave byte.
- bit 4 **P:** Stop bit
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last
Hardware is set or clear when a Start, Repeated Start or Stop is detected.

REGISTER 19-2: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

- bit 3 **S:** Start bit
1 = Indicates that a Start (or Repeated Start) bit has been detected last
0 = Start bit was not detected last
Hardware is set or clear when a Start, Repeated Start or Stop is detected.
- bit 2 **R_W:** Read/Write Information bit (when operating as I²C slave)
1 = Read – Indicates data transfer is output from the slave
0 = Write – Indicates data transfer is input to the slave
Hardware is set or clear after reception of an I²C device address byte.
- bit 1 **RBF:** Receive Buffer Full Status bit
1 = Receive is complete, I2CxRCV is full
0 = Receive is not complete, I2CxRCV is empty
Hardware is set when I2CxRCV is written with a received byte. Hardware is clear when software reads I2CxRCV.
- bit 0 **TBF:** Transmit Buffer Full Status bit
1 = Transmit in progress, I2CxTRN is full
0 = Transmit is complete, I2CxTRN is empty
Hardware is set when software writes to I2CxTRN. Hardware is clear at completion of a data transmission.

bit 9-0

AMSK[9:0]: Address Mask Select bits

For 10-Bit Address:

1 = Enables masking for bit Ax of incoming message address; bit match is not required in this position

0 = Disables masking for bit Ax; bit match is required in this position

For 7-Bit Address (I2CxMSK[6:0] only):

1 = Enables masking for bit Ax + 1 of incoming message address; bit match is not required in this position

0 = Disables masking for bit Ax + 1; bit match is required in this position

20.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Universal Asynchronous Receiver Transmitter (UART)**” (www.microchip.com/DS70000582) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X family of devices contains two UART modules.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X device family. The UART is a full-duplex, asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/J2602, RS-232 and RS-485 interfaces.

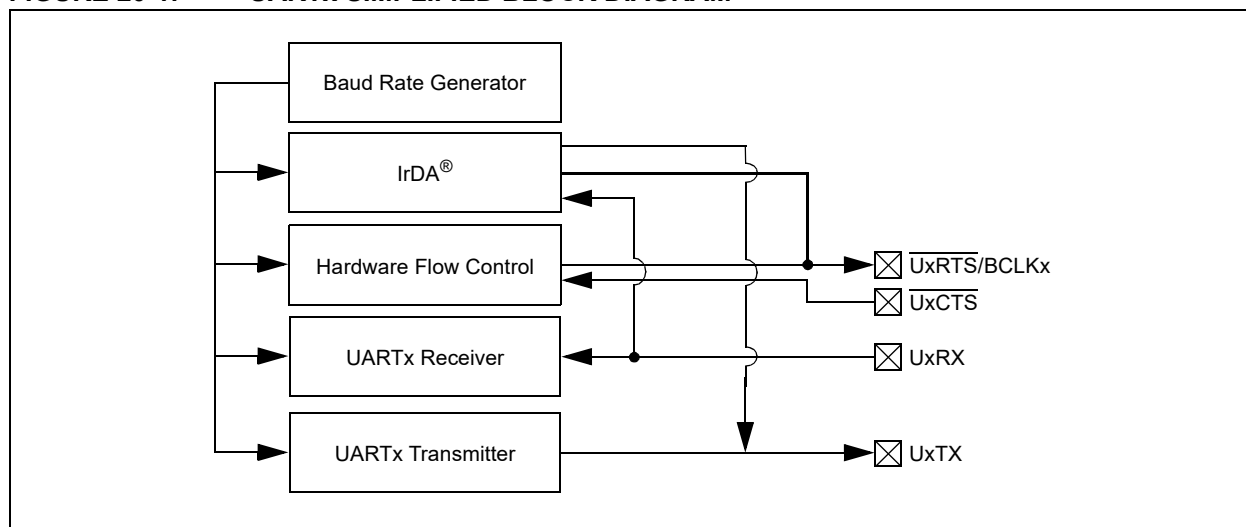

The module also supports a hardware flow control option with the $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins, and also includes an IrDA® encoder and decoder.

Note: Hardware flow control using $\overline{\text{UxRTS}}$ and $\overline{\text{UxCTS}}$ is not available on all pin count devices. See the “[Pin Diagrams](#)” section for availability.

The primary features of the UARTx module are:

- Full-Duplex, 8 or 9-Bit Data Transmission through the UxTX and UxRX Pins
- Even, Odd or No Parity Options (for 8-bit data)
- One or Two Stop bits
- Hardware Flow Control Option with $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ Pins
- Fully Integrated Baud Rate Generator with 16-Bit Prescaler
- Baud Rates Ranging from 4.375 Mbps to 67 bps at 16x mode at 70 MIPS
- Baud Rates Ranging from 17.5 Mbps to 267 bps at 4x mode at 70 MIPS
- 4-Deep First-In First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-bit mode with Address Detect (9th bit = 1)
- Transmit and Receive Interrupts
- A Separate Interrupt for all UARTx Error Conditions
- Loopback mode for Diagnostic Support

FIGURE 20-1: UARTx SIMPLIFIED BLOCK DIAGRAM

20.1 UART Helpful Tips

1. In multinode, direct-connect UART networks, UART receive inputs react to the complementary logic level defined by the URXINV bit (UxMODE[4]), which defines the Idle state, the default of which is logic high (i.e., URXINV = 0). Because remote devices do not initialize at the same time, it is likely that one of the devices, because the RX line is floating, will trigger a Start bit detection and will cause the first byte received, after the device has been initialized, to be invalid. To avoid this situation, the user should use a pull-up or pull-down resistor on the RX pin depending on the value of the URXINV bit.
 - a) If URXINV = 0, use a pull-up resistor on the RX pin.
 - b) If URXINV = 1, use a pull-down resistor on the RX pin.
2. The first character received on a wake-up from Sleep mode caused by activity on the UxRX pin of the UARTx module will be invalid. In Sleep mode, peripheral clocks are disabled. By the time the oscillator system has restarted and stabilized from Sleep mode, the baud rate bit sampling clock, relative to the incoming UxRX bit timing, is no longer synchronized, resulting in the first character being invalid; this is to be expected.

20.2 UART Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

11 = Reserved; do not use

10 = Interrupt when a character is transferred to the Transmit Shift Register (TSR) and as a result, the transmit buffer becomes empty

01 = Interrupt when the last character is shifted out of the Transmit Shift Register; all transmit operations are completed

00 = Interrupt when a character is transferred to the Transmit Shift Register (this implies there is at least one character open in the transmit buffer)

bit 14 **UTXINV:** UARTx Transmit Polarity Inversion bit

If IREN = 0:

1 = UxTX Idle state is '0'

0 = UxTX Idle state is '1'

If IREN = 1:

1 = IrDA encoded, UxTX Idle state is '1'

0 = IrDA encoded, UxTX Idle state is '0'

bit 12 **Unimplemented:** Read as '0'

bit 11 **UTXBRK:** UARTx Transmit Break bit

1 = Sends Sync Break on next transmission – Start bit, followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion

0 = Sync Break transmission is disabled or completed

bit 10 **UTXEN:** UARTx Transmit Enable bit⁽¹⁾

1 = Transmit is enabled, UxTX pin is controlled by UARTx

0 = Transmit is disabled, any pending transmission is aborted and buffer is reset; UxTX pin is controlled by the PORT

bit 9 **UTXBF:** UARTx Transmit Buffer Full Status bit (read-only)

1 = Transmit buffer is full

0 = Transmit buffer is not full, at least one more character can be written

bit 8 **TRMT:** Transmit Shift Register Empty bit (read-only)

1 = Transmit Shift Register is empty and transmit buffer is empty (the last transmission has completed)

0 = Transmit Shift Register is not empty, a transmission is in progress or queued

bit 7-6 **URXISEL[1:0]:** UARTx Receive Interrupt Mode Selection bits

11 = Interrupt is set on UxRSR transfer, making the receive buffer full (i.e., has four data characters)

10 = Interrupt is set on UxRSR transfer, making the receive buffer 3/4 full (i.e., has three data characters)

0x = Interrupt is set when any character is received and transferred from the UxRSR to the receive buffer; receive buffer has one or more characters

Note 1: Refer to “Universal Asynchronous Receiver Transmitter (UART)” (www.microchip.com/DS70000582) in the “dsPIC33/PIC24 Family Reference Manual” for information on enabling the UARTx module for transmit operation.

REGISTER 20-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 5 **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)
1 = Address Detect mode is enabled; if 9-bit mode is not selected, this does not take effect
0 = Address Detect mode is disabled
- bit 4 **RIDLE:** Receiver Idle bit (read-only)
1 = Receiver is Idle
0 = Receiver is active
- bit 3 **PERR:** Parity Error Status bit (read-only)
1 = Parity error has been detected for the current character (character at the top of the receive FIFO)
0 = Parity error has not been detected
- bit 2 **FERR:** Framing Error Status bit (read-only)
1 = Framing error has been detected for the current character (character at the top of the receive FIFO)
0 = Framing error has not been detected
- bit 1 **OERR:** Receive Buffer Overrun Error Status bit (clear/read-only)
1 = Receive buffer has overflowed
0 = Receive buffer has not overflowed; clearing a previously set OERR bit (1 → 0 transition) resets the receiver buffer and the UxRSR to the empty state
- bit 0 **URXDA:** UARTx Receive Buffer Data Available bit (read-only)
1 = Receive buffer has data, at least one more character can be read
0 = Receive buffer is empty

Note 1: Refer to “Universal Asynchronous Receiver Transmitter (UART)” (www.microchip.com/DS70000582) in the “*dsPIC33/PIC24 Family Reference Manual*” for information on enabling the UARTx module for transmit operation.

21.0 ENHANCED CAN (ECAN™) MODULE (dsPIC33EPXXXGP/MC50X DEVICES ONLY)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Enhanced Controller Area Network (ECAN™)**” (www.microchip.com/DS70353) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

21.1 Overview

The Enhanced Controller Area Network (ECAN) module is a serial interface, useful for communicating with other CAN modules or microcontroller devices. This interface/protocol was designed to allow communications within noisy environments. The dsPIC33EPXXXGP/MC50X devices contain one ECAN module.

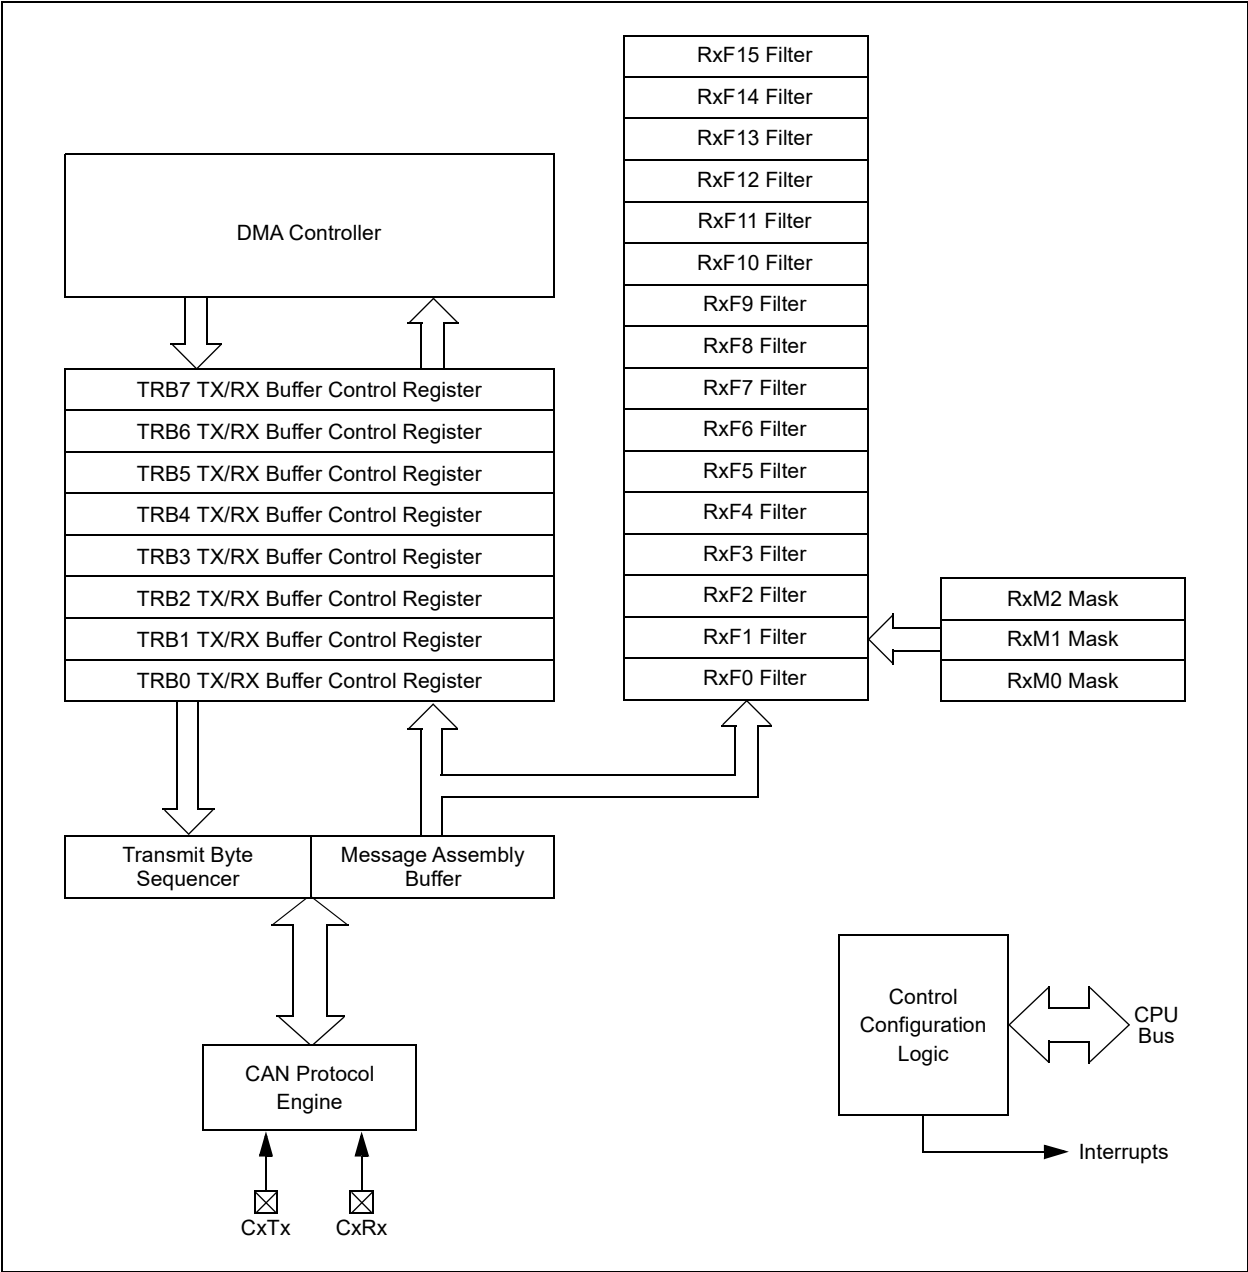

The ECAN module is a communication controller implementing the CAN 2.0 A/B protocol, as defined in the BOSCH CAN specification. The module supports CAN 1.2, CAN 2.0A, CAN 2.0B Passive and CAN 2.0B Active versions of the protocol. The module implementation is a full CAN system. The CAN specification is not covered within this data sheet. The reader can refer to the BOSCH CAN specification for further details.

The ECAN module features are as follows:

- Implementation of the CAN Protocol, CAN 1.2, CAN 2.0A and CAN 2.0B
- Standard and Extended Data Frames
- 0-8 Bytes Data Length
- Programmable Bit Rate Up to 1 Mbit/sec
- Automatic Response to Remote Transmission Requests
- Up to Eight Transmit Buffers with Application-Specified Prioritization and Abort Capability (each buffer can contain up to 8 bytes of data)
- Up to 32 Receive Buffers (each buffer can contain up to 8 bytes of data)
- Up to 16 Full (Standard/Extended Identifier) Acceptance Filters
- Three Full Acceptance Filter Masks
- DeviceNet™ Addressing Support
- Programmable Wake-up Functionality with Integrated Low-Pass Filter
- Programmable Loopback mode supports Self-Test Operation
- Signaling via Interrupt Capabilities for All CAN Receiver and Transmitter Error States
- Programmable Clock Source
- Programmable Link to Input Capture (IC2) module for Timestamping and Network Synchronization
- Low-Power Sleep and Idle mode

The CAN bus module consists of a protocol engine and message buffering/control. The CAN protocol engine handles all functions for receiving and transmitting messages on the CAN bus. Messages are transmitted by first loading the appropriate data registers. Status and errors can be checked by reading the appropriate registers. Any message detected on the CAN bus is checked for errors and then matched against filters to see if it should be received and stored in one of the receive registers.

FIGURE 21-1: ECAN™ MODULE BLOCK DIAGRAM

21.2 Modes of Operation

The ECAN module can operate in one of several operation modes selected by the user. These modes include:

- Initialization mode
- Disable mode
- Normal Operation mode
- Listen Only mode
- Listen All Messages mode
- Loopback mode

Modes are requested by setting the REQOP[2:0] bits (CxCTRL1[10:8]). Entry into a mode is Acknowledged by monitoring the OPMODE[2:0] bits (CxCTRL1[7:5]). The module does not change the mode and the OPMODEx bits until a change in mode is acceptable, generally during bus Idle time, which is defined as at least 11 consecutive recessive bits.

21.3 ECAN Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

0 = Message did not lose arbitration while being sent

bit 4 **TXERRm**: Error Detected During Transmission bit⁽¹⁾

1 = A bus error occurred while the message was being sent

0 = A bus error did not occur while the message was being sent

bit 3 **TXREQm**: Message Send Request bit

1 = Requests that a message be sent; the bit automatically clears when the message is successfully sent

0 = Clearing the bit to '0' while set requests a message abort

bit 2 **RTRENm**: Auto-Remote Transmit Enable bit

1 = When a remote transmit is received, TXREQ will be set

0 = When a remote transmit is received, TXREQ will be unaffected

bit 1-0 **TXmPRI[1:0]**: Message Transmission Priority bits

11 = Highest message priority

10 = High intermediate message priority

01 = Low intermediate message priority

00 = Lowest message priority

Note 1: This bit is cleared when TXREQ is set.
Note: The buffers, SID, EID, DLC, Data Field, and Receive Status registers are located in DMA RAM.

21.5 ECAN Message Buffers

ECAN Message Buffers are part of RAM memory. They are not ECAN Special Function Registers. The user application must directly write into the RAM area that is configured for ECAN Message Buffers. The location and size of the buffer area is defined by the user application.

Note 1: Only written by module for receive buffers, unused for transmit buffers.

NOTES:

22.0 CHARGE TIME MEASUREMENT UNIT (CTMU)

- Note 1:** This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Charge Time Measurement Unit (CTMU)**” (www.microchip.com/DS70661) in the “dsPIC33/PIC24 Family Reference Manual”.
- 2:** Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

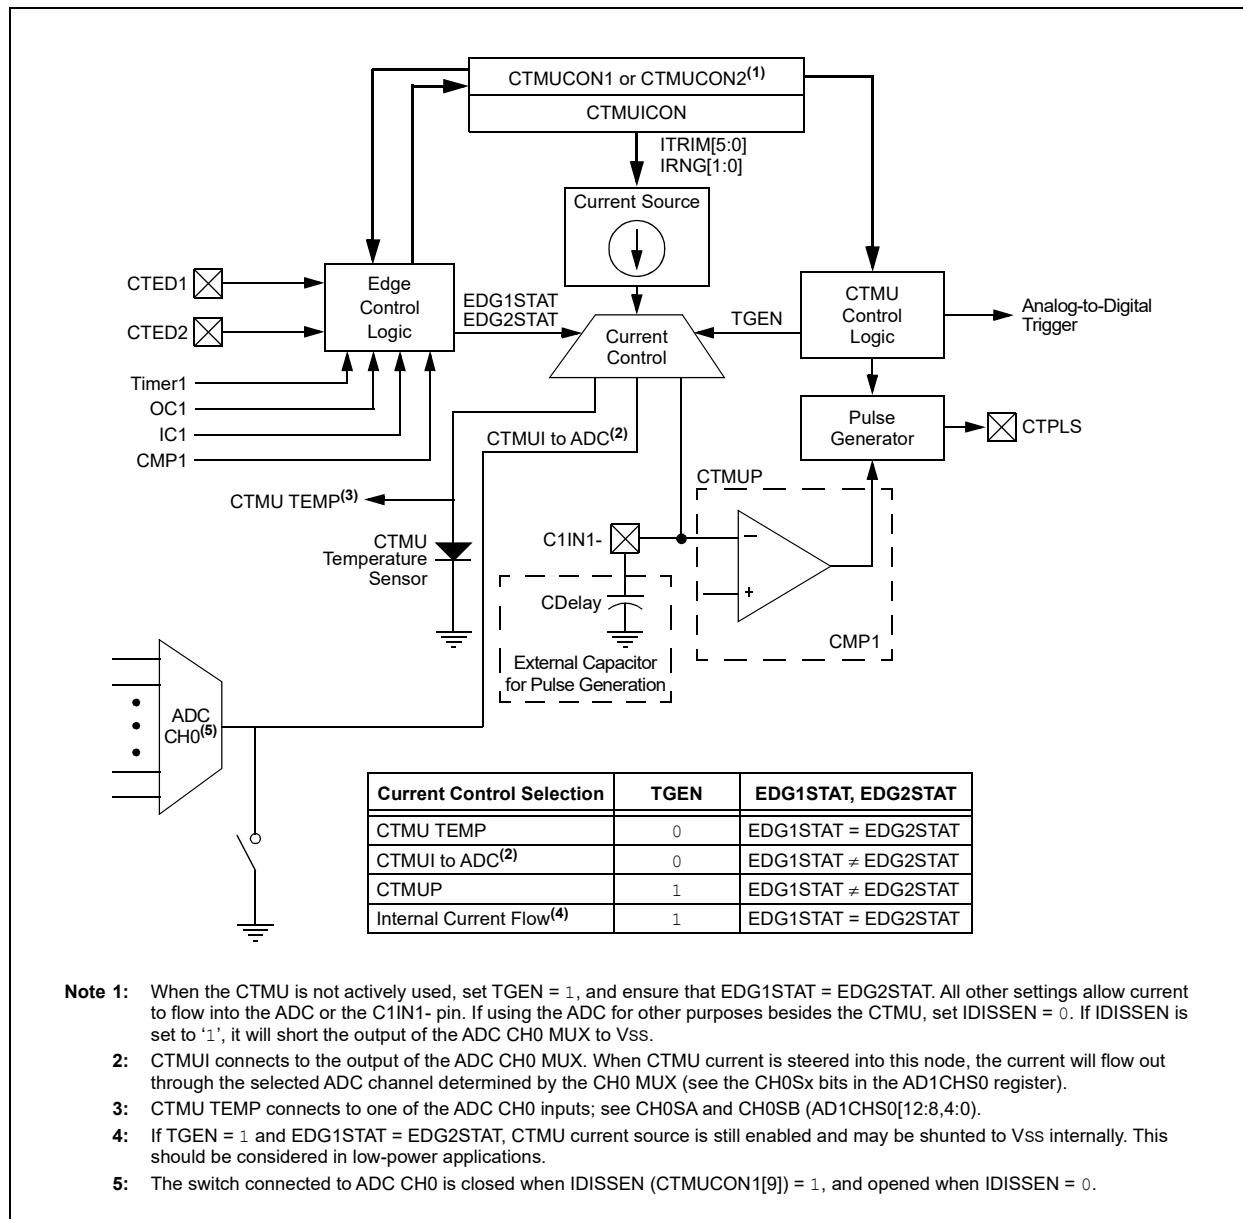

The Charge Time Measurement Unit is a flexible analog module that provides accurate differential time measurement between pulse sources, as well as asynchronous pulse generation. Its key features include:

- Four Edge Input Trigger Sources
- Polarity Control for Each Edge Source
- Control of Edge Sequence
- Control of Response to Edges
- Precise Time Measurement Resolution of 1 ns
- Accurate Current Source Suitable for Capacitive Measurement
- On-Chip Temperature Measurement using a Built-in Diode

Together with other on-chip analog modules, the CTMU can be used to precisely measure time, measure capacitance, measure relative changes in capacitance or generate output pulses that are independent of the system clock.

The CTMU module is ideal for interfacing with capacitive-based sensors. The CTMU is controlled through three registers: CTMUCON1, CTMUCON2 and CTMUICON. CTMUCON1 and CTMUCON2 enable the module and control edge source selection, edge source polarity selection and edge sequencing. The CTMUICON register controls the selection and trim of the current source.

FIGURE 22-1: CTMU BLOCK DIAGRAM

22.1 CTMU Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

 0 = Analog current source output is not grounded
- bit 8 **CTTRIG:** ADC Trigger Control bit
 1 = CTMU triggers ADC start of conversion
 0 = CTMU does not trigger ADC start of conversion
- bit 7-0 **Unimplemented:** Read as '0'

Note 1: The ADC module Sample-and-Hold capacitor is not automatically discharged between sample/conversion cycles. Software using the ADC as part of a capacitance measurement must discharge the ADC capacitor before conducting the measurement. The IDISSEN bit, when set to '1', performs this function. The ADC must be sampling while the IDISSEN bit is active to connect the discharge sink to the capacitor array.

NOTES:

23.0 10-BIT/12-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Analog-to-Digital Converter (ADC)**” (www.microchip.com/DS70621) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices have one ADC module. The ADC module supports up to 16 analog input channels.

On ADC1, the AD12B bit (AD1CON1[10]) allows the ADC module to be configured by the user as either a 10-bit, four Sample-and-Hold (S&H) ADC (default configuration) or a 12-bit, one S&H ADC.

Note: The ADC module needs to be disabled before modifying the AD12B bit.

23.1 Key Features

23.1.1 10-BIT ADC CONFIGURATION

The 10-bit ADC configuration has the following key features:

- Successive Approximation (SAR) Conversion
- Conversion Speeds of Up to 1.1 Msps
- Up to 16 Analog Input Pins
- Connections to Three Internal Op Amps
- Connections to the Charge Time Measurement Unit (CTMU) and Temperature Measurement Diode
- Channel Selection and Triggering can be Controlled by the Peripheral Trigger Generator (PTG)
- External Voltage Reference Input Pins
- Simultaneous Sampling of:
 - Up to four analog input pins
 - Three op amp outputs
 - Combinations of analog inputs and op amp outputs
- Automatic Channel Scan mode
- Selectable Conversion Trigger Source
- Selectable Buffer Fill modes
- Four Result Alignment Options (signed/unsigned, fractional/integer)
- Operation during CPU Sleep and Idle modes

23.1.2 12-BIT ADC CONFIGURATION

The 12-bit ADC configuration supports all the features listed above, with the exception of the following:

- In the 12-bit configuration, conversion speeds of up to 500 ksps are supported
- There is only one S&H amplifier in the 12-bit configuration; therefore, simultaneous sampling of multiple channels is not supported

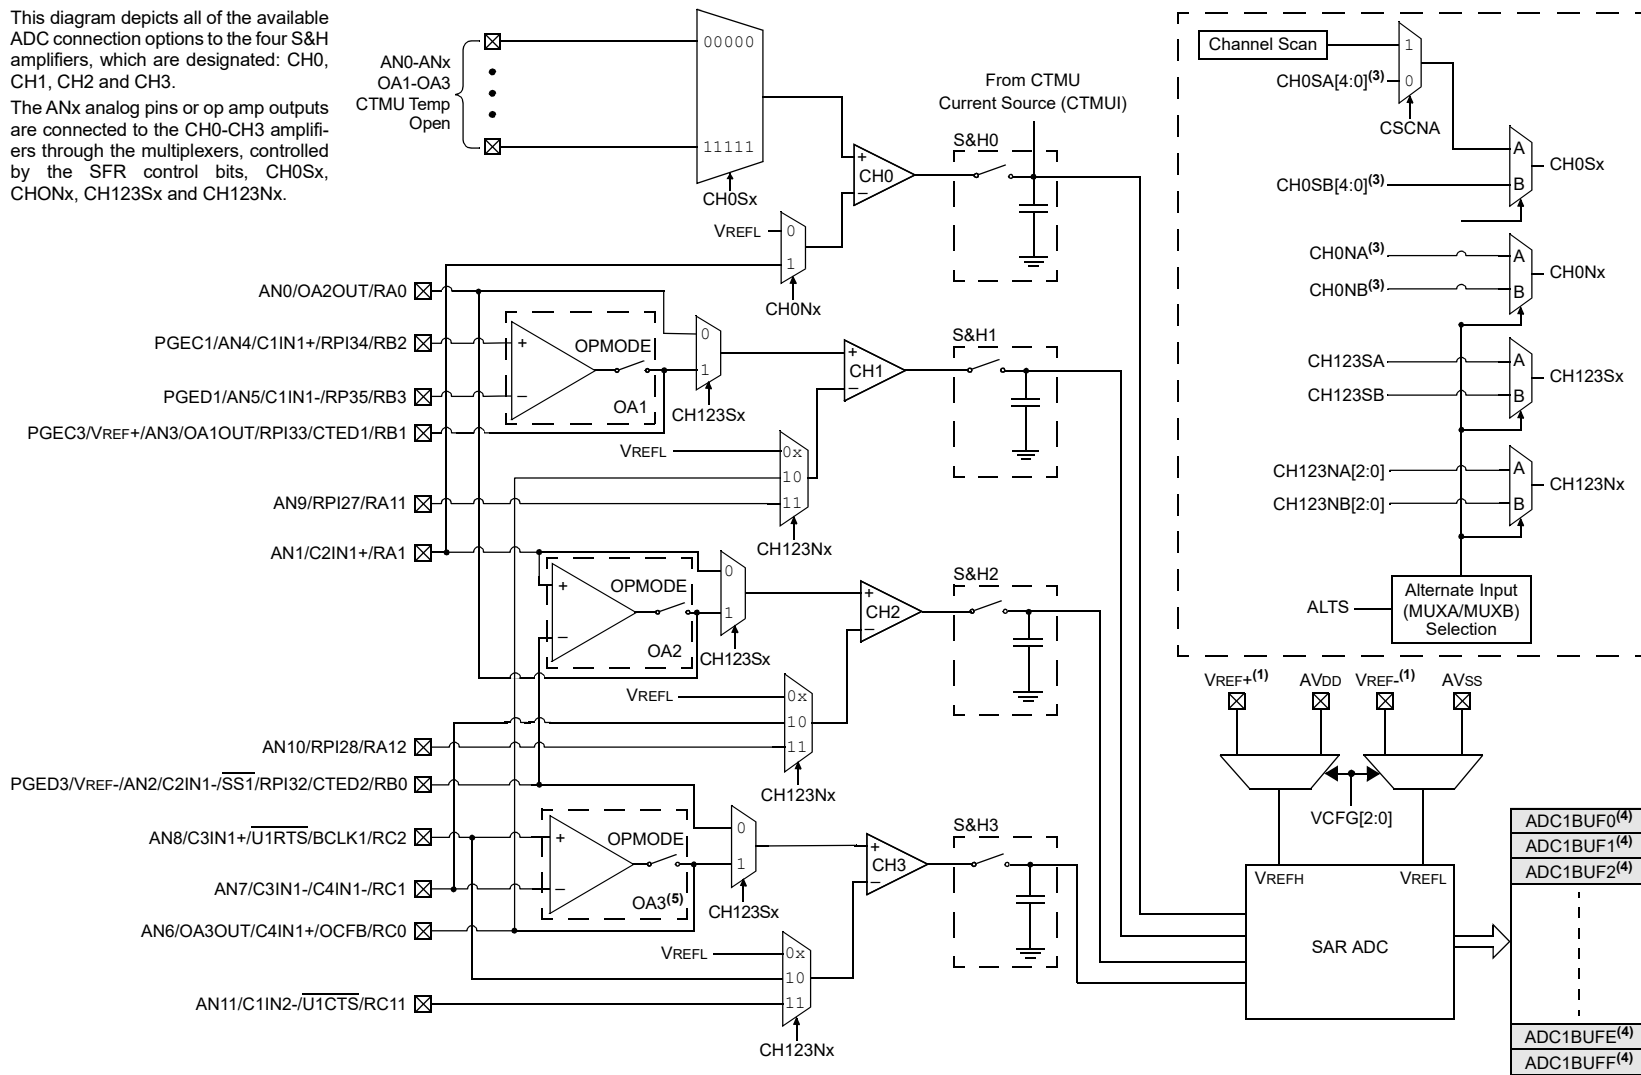

Depending on the particular device pinout, the ADC can have up to 16 analog input pins, designated AN0 through AN15. These analog inputs are shared with op amp inputs and outputs, comparator inputs, and external voltage references. When op amp/comparator functionality is enabled, or an external voltage reference is used, the analog input that shares that pin is no longer available. The actual number of analog input pins, op amps and external voltage reference input configuration depends on the specific device.

A block diagram of the ADC module is shown in [Figure 23-1](#). [Figure 23-2](#) provides a diagram of the ADC conversion clock period.

FIGURE 23-1: ADC MODULE BLOCK DIAGRAM WITH CONNECTION OPTIONS FOR ANx PINS AND OP AMPS

This diagram depicts all of the available ADC connection options to the four S&H amplifiers, which are designated: CH0, CH1, CH2 and CH3.

The ANx analog pins or op amp outputs are connected to the CH0-CH3 amplifiers through the multiplexers, controlled by the SFR control bits, CH0Sx, CHONx, CH123Sx and CH123Nx.

- Note**
- 1: VREF+, VREF- inputs can be multiplexed with other analog inputs.
 - 2: Channels 1, 2 and 3 are not applicable for the 12-bit mode of operation.
 - 3: These bits can be updated with Step commands from the PTG module. See [Section 24.0 "Peripheral Trigger Generator \(PTG\) Module"](#) for more information.
 - 4: When ADDMAEN (AD1CON4[8]) = 1, enabling DMA, only ADC1BUF0 is used.
 - 5: OA3 is not available for 28-pin devices.

FIGURE 23-2: ADC CONVERSION CLOCK PERIOD BLOCK DIAGRAM

23.2 ADC Helpful Tips

1. The SMP1x control bits in the AD1CON2 register:
 - a) Determine when the ADC interrupt flag is set and an interrupt is generated, if enabled.
 - b) When the CSCNA bit in the AD1CON2 register is set to '1', this determines when the ADC analog scan channel list, defined in the AD1CSSL/AD1CSSH registers, starts over from the beginning.
 - c) When the DMA peripheral is not used (ADDMAEN = 0), this determines when the ADC Result Buffer Pointer to ADC1BUF0-ADC1BUFF gets reset back to the beginning at ADC1BUF0.
 - d) When the DMA peripheral is used (ADDMAEN = 1), this determines when the DMA Address Pointer is incremented after a sample/conversion operation. ADC1BUF0 is the only ADC buffer used in this mode. The ADC Result Buffer Pointer to ADC1BUF0-ADC1BUFF gets reset back to the beginning at ADC1BUF0. The DMA address is incremented after completion of every 32nd sample/conversion operation. Conversion results are stored in the ADC1BUF0 register for transfer to RAM using DMA.
2. When the DMA module is disabled (ADDMAEN = 0), the ADC has 16 result buffers. ADC conversion results are stored sequentially in ADC1BUF0-ADC1BUFF, regardless of which analog inputs are being used subject to the SMP1x bits and the condition described in 1c) above. There is no relationship between the ANx input being measured and which ADC buffer (ADC1BUF0-ADC1BUFF) that the conversion results will be placed in.
3. When the DMA module is enabled (ADDMAEN = 1), the ADC module has only one ADC result buffer (i.e., ADC1BUF0) per ADC peripheral and the ADC conversion result must be read, either by the CPU or DMA Controller, before the next ADC conversion is complete to avoid overwriting the previous value.
4. The DONE bit (AD1CON1[0]) is only cleared at the start of each conversion and is set at the completion of the conversion, but remains set indefinitely, even through the next sample phase until the next conversion begins. If application code is monitoring the DONE bit in any kind of software loop, the user must consider this behavior because the CPU code execution is faster than the ADC. As a result, in Manual Sample mode, particularly where the user's code is setting the SAMP bit (AD1CON1[1]), the DONE bit should also be cleared by the user application just before setting the SAMP bit.

5. Enabling op amps, comparator inputs and external voltage references can limit the availability of analog inputs (ANx pins). For example, when Op Amp 2 is enabled, the pins for AN0, AN1 and AN2 are used by the op amp's inputs and output. This negates the usefulness of Alternate Input mode since the MUXA selections use AN0-AN2. Carefully study the ADC block diagram to determine the configuration that will best suit your application. Configuration examples are available in the "**Analog-to-Digital Converter (ADC)**" (www.microchip.com/DS70621) section in the "*dsPIC33/PIC24 Family Reference Manual*".

23.3 ADC Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

24.0 PERIPHERAL TRIGGER GENERATOR (PTG) MODULE

- Note 1:** This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Peripheral Trigger Generator (PTG)**” (www.microchip.com/DS70000669) in the “*dsPIC33/PIC24 Family Reference Manual*”.
- 2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

24.1 Module Introduction

The Peripheral Trigger Generator (PTG) provides a means to schedule complex high-speed peripheral operations that would be difficult to achieve using software. The PTG module uses 8-bit commands, called “Steps”, that the user writes to the PTG Queue registers (PTGQUE0-PTGQUE7). The registers perform operations, such as wait for input signal, generate output trigger and wait for timer.

The PTG module has the following major features:

- Multiple Clock Sources
- Two 16-Bit General Purpose Timers
- Two 16-Bit General Limit Counters
- Configurable for Rising or Falling Edge Triggering
- Generates Processor Interrupts to Include:
 - Four configurable processor interrupts
 - Interrupt on a Step event in Single-Step mode
 - Interrupt on a PTG Watchdog Timer time-out
- Able to Receive Trigger Signals from these Peripherals:
 - ADC
 - PWM
 - Output Compare
 - Input Capture
 - Op Amp/Comparator
 - INT2
- Able to Trigger or Synchronize to these Peripherals:
 - Watchdog Timer
 - Output Compare
 - Input Capture
 - ADC
 - PWM
 - Op Amp/Comparator

24.2 PTG Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](#), contains the latest updates and additional information.

 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 15-0 **PTGSDLIM[15:0]:** PTG Step Delay Limit Register bits
 Holds a PTG Step delay value representing the number of additional PTG clocks between the start of a Step command and the completion of a Step command.

- Note 1:** A base Step delay of one PTG clock is added to any value written to the PTGSDLIM register (Step Delay = (PTGSDLIM) + 1).
Note 2: This register is read-only when the PTG module is executing Step commands (PTGEN = 1 and PTGSTRT = 1).

REGISTER 24-7: PTGC0LIM: PTG COUNTER 0 LIMIT REGISTER⁽¹⁾

bit 15-8 **STEP(2x + 1)[7:0]:** PTG Step Queue Pointer Register bits⁽²⁾

A queue location for storage of the STEP(2x + 1) command byte.

bit 7-0 **STEP(2x)[7:0]:** PTG Step Queue Pointer Register bits⁽²⁾

A queue location for storage of the STEP(2x) command byte.

Note 1: This register is read-only when the PTG module is executing Step commands (PTGEN = 1 and PTGSTRT = 1).

2: Refer to [Table 24-1](#) for the Step command encoding.

3: The Step registers maintain their values on any type of Reset.

24.4 Step Commands and Format

TABLE 24-1: PTG STEP COMMAND FORMAT

| | | | |
|--------------------|-------|-------------|-------|
| Step Command Byte: | | | |
| STEPx[7:0] | | | |
| CMD[3:0] | | OPTION[3:0] | |
| bit 7 | bit 4 | bit 3 | bit 0 |

| bit 7-4 | CMD[3:0] | Step Command | Command Description |
|---------|----------|--------------|--|
| | 0000 | PTGCTRL | Execute control command as described by OPTION[3:0]. |
| | 0001 | PTGADD | Add contents of PTGADJ register to target register as described by OPTION[3:0]. |
| | | PTGCOPY | Copy contents of PTGHOLD register to target register as described by OPTION[3:0]. |
| | 001x | PTGSTRB | Copy the value contained in CMD[0]:OPTION[3:0] to the CH0SA[4:0] bits (AD1CHS0[4:0]). |
| | 0100 | PTGWHI | Wait for a low-to-high edge input from the selected PTG trigger input as described by OPTION[3:0]. |
| | 0101 | PTGWLO | Wait for a high-to-low edge input from the selected PTG trigger input as described by OPTION[3:0]. |
| | 0110 | Reserved | Reserved. |
| | 0111 | PTGIRQ | Generate individual interrupt request as described by OPTION3[0]. |
| | 100x | PTGTRIG | Generate individual trigger output as described by <<CMD[0]:OPTION[3:0]>. |
| | 101x | PTGJMP | Copy the value indicated in <<CMD[0]:OPTION[3:0]> to the Queue Pointer (PTGQPTR) and jump to that Step queue. |
| | 110x | PTGJMPC0 | PTGC0 = PTGC0LIM: Increment the Queue Pointer (PTGQPTR). |
| | | | PTGC0 ≠ PTGC0LIM: Increment Counter 0 (PTGC0) and copy the value indicated in <<CMD[0]:OPTION[3:0]> to the Queue Pointer (PTGQPTR), and jump to that Step queue |
| | 111x | PTGJMPC1 | PTGC1 = PTGC1LIM: Increment the Queue Pointer (PTGQPTR). |
| | | | PTGC1 ≠ PTGC1LIM: Increment Counter 1 (PTGC1) and copy the value indicated in <<CMD[0]:OPTION[3:0]> to the Queue Pointer (PTGQPTR), and jump to that Step queue. |

- Note 1:** All reserved commands or options will execute but have no effect (i.e., execute as a NOP instruction).
- Note 2:** Refer to [Table 24-2](#) for the trigger output descriptions.
- Note 3:** This feature is only available on dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices.

TABLE 24-1: PTG STEP COMMAND FORMAT (CONTINUED)

| bit 3-0 | Step Command | OPTION[3:0] | Option Description |

Note 1: This feature is only available on dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices.

NOTES:

25.0 OP AMP/COMPARATOR MODULE

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Op Amp/Comparator” (www.microchip.com/DS70000357) in the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices contain up to four comparators, which can be configured in various ways. Comparators, CMP1, CMP2 and CMP3, also have the option to be configured as op amps, with the output being brought to an external pin for gain/filtering connections. As shown in [Figure 25-1](#), individual comparator options are specified by the comparator module's Special Function Register (SFR) control bits.

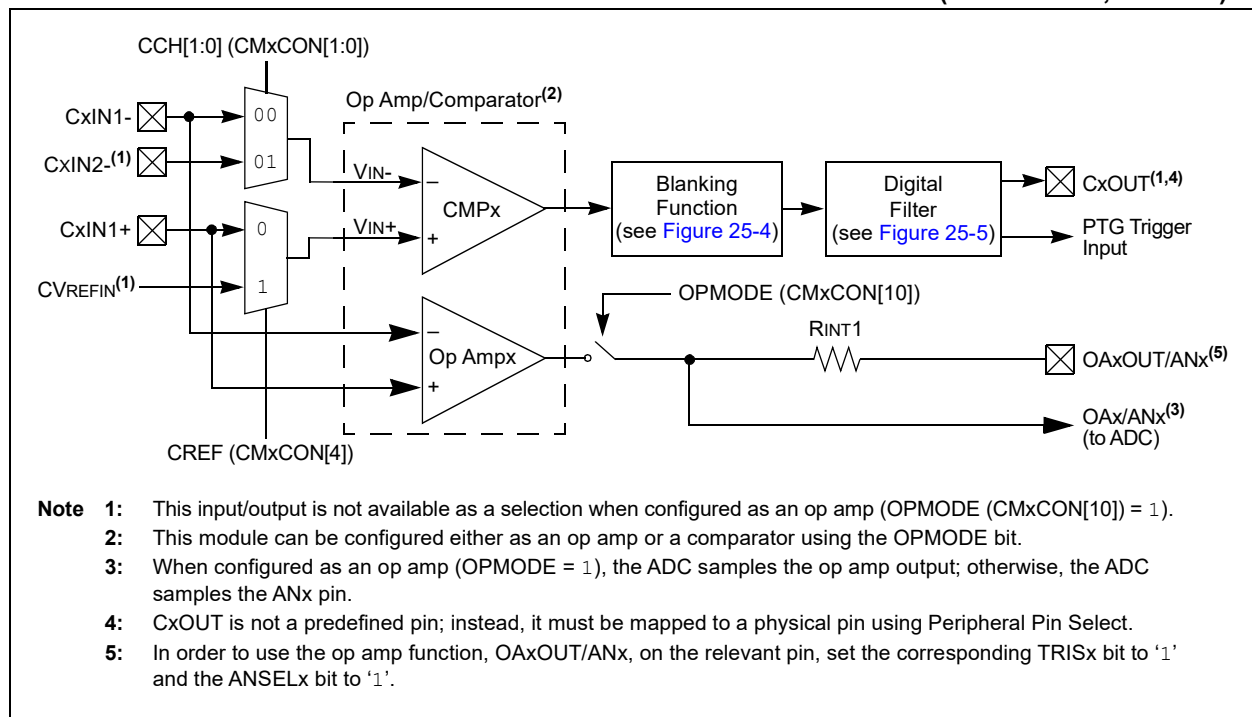

Note: Op Amp/Comparator 3 is not available on the dsPIC33EPXXXGP502/MC502/MC202 and PIC24EP256GP/MC202 (28-pin) devices.

These options allow users to:

- Select the edge for trigger and interrupt generation
- Configure the comparator voltage reference
- Configure output blanking and masking
- Configure as a comparator or op amp (CMP1, CMP2 and CMP3 only)

Note: Not all op amp/comparator input/output connections are available on all devices. See the “[Pin Diagrams](#)” section for available connections.

FIGURE 25-1: OP AMP/COMPARATOR x MODULE BLOCK DIAGRAM (MODULES 1, 2 AND 3)

The diagram illustrates the internal structure of the C4 module. It features two 2-to-1 multiplexers. The first multiplexer selects between inputs OA1/AN3 (01), OA2/AN0 (10), OA3/AN6 (11), and C4IN1- (00) based on the CCH[1:0] (CM4CON[1:0]) control signal. Its output is VIN-. The second multiplexer selects between inputs C4IN1+ (1) and CVREFIN (0) based on the CREF (CMxCON[4]) control signal. Its output is VIN+. These two signals are fed into a comparator block labeled CMP4. The output of the comparator passes through a Blanking Function block (referenced to Figure 25-4) and then a Digital Filter block (referenced to Figure 25-5). The final outputs are C4OUT and a Trigger Output.

The diagram illustrates the internal structure of the VREF module. It features a 16-to-1 multiplexer (MUX) at its core. The MUX's inputs are connected to a ladder network of resistors. The top of this network is connected to CVRSS, which can be selected between VREF+ (when CVRSS = 1) and AVDD (when CVRSS = 0) via a switch. A CVREN pin, when pulled up, enables the circuit. The ladder network consists of a series of resistors, with the top resistor being 8R and the others being R. The bottom of the network is connected to a current source (CVRR) and a resistor (8R) leading to AVSS. The MUX is controlled by bits CVR0, CVR1, CVR2, and CVR3 from the CVRCON[3:0] register. The MUX output is connected to a switch controlled by CVR10E (CVRCON[6]), which can route the signal to CVREFIN or CVREF10. CVREF10 is then buffered by an op-amp. Another switch, controlled by CVR20E (CVRCON[14]), can route the signal to CVREF20, which is also buffered by an op-amp. The CVRCON[10] register bit, VREFSEL, selects between CVREFIN and CVREF20 for the final output.

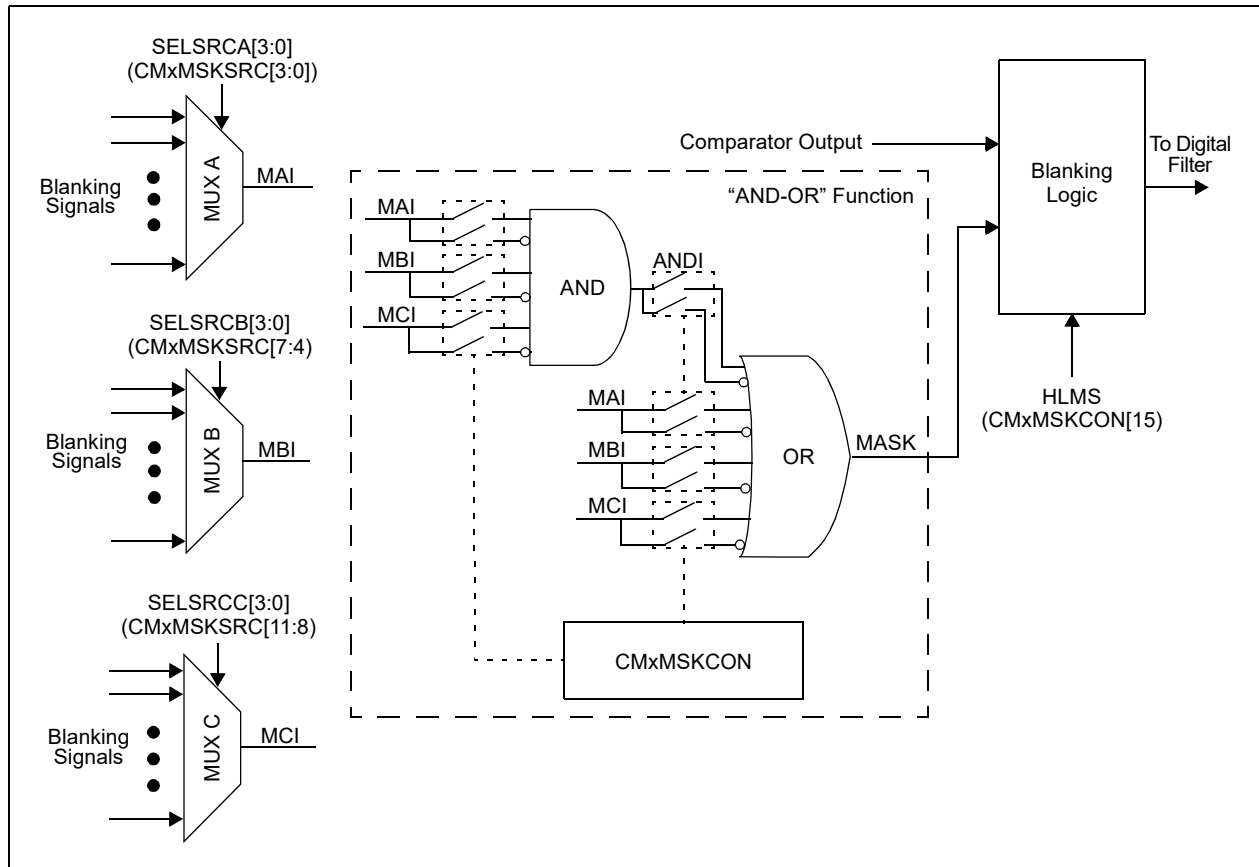

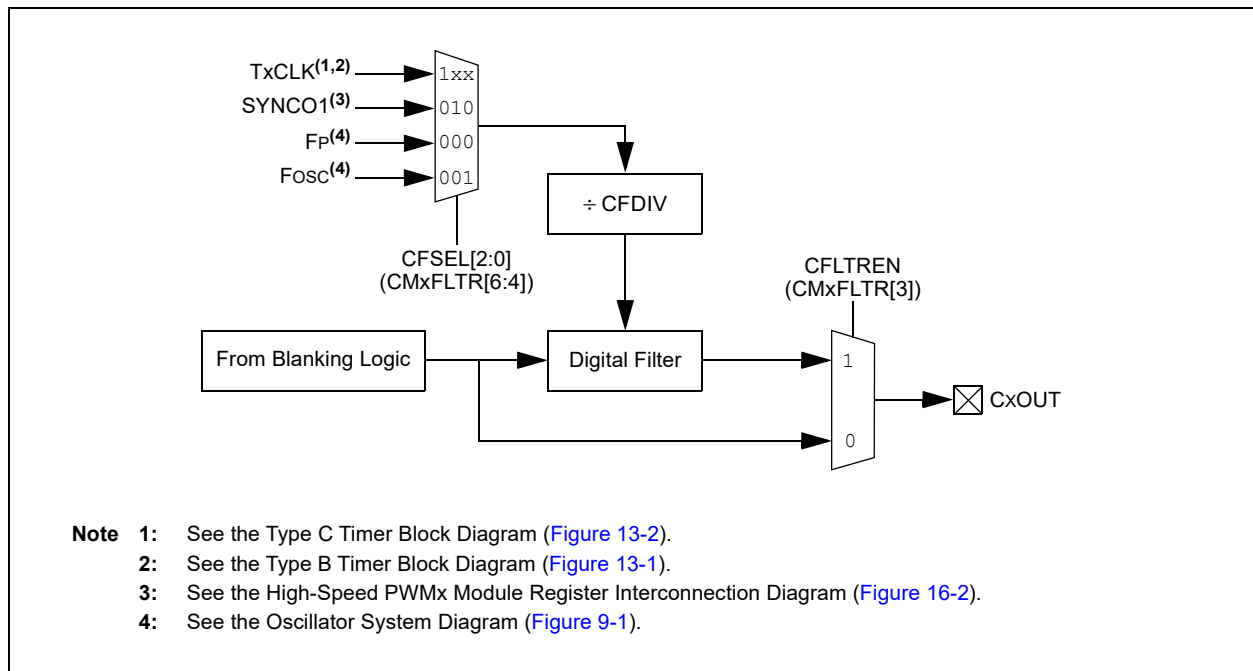

FIGURE 25-5: DIGITAL FILTER INTERCONNECT BLOCK DIAGRAM

25.1 Op Amp Application Considerations

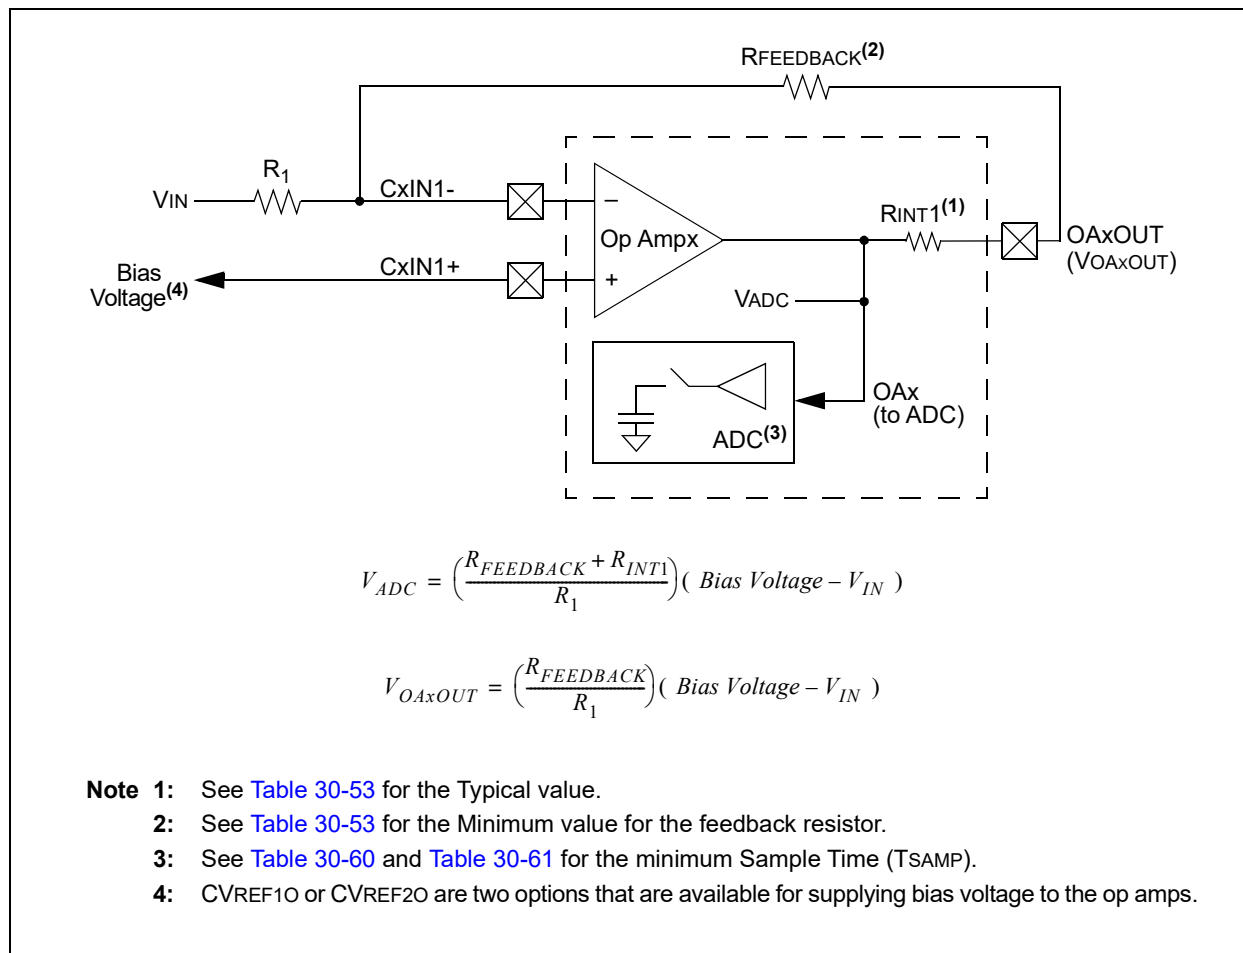

There are two configurations to take into consideration when designing with the op amp modules that are available in the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices. Configuration A (see Figure 25-6) takes advantage of the internal connection to the ADC module to route the output of the op amp directly to the ADC for measurement. Configuration B (see Figure 25-7) requires that the designer externally route the output of the op amp (OAxOUT) to a separate analog input pin (ANy) on the device. Table 30-55 in Section 30.0 “Electrical Characteristics” describes the performance characteristics for the op amps, distinguishing between the two configuration types where applicable.

When the op amp output is made available on the corresponding OAxOUT pin, set both the pin's TRISx bit and the corresponding ANSELx bit to '1'.

25.1.1 OP AMP CONFIGURATION A

Figure 25-6 shows a typical inverting amplifier circuit taking advantage of the internal connections from the op amp output to the input of the ADC. The advantage of this configuration is that the user does not need to consume another analog input (ANy) on the device, and allows the user to simultaneously sample all three op amps with the ADC module, if needed. However, the presence of the internal resistance, RINT1, adds an error in the feedback path. Since RINT1 is an internal resistance, in relation to the op amp output (VOAxOUT) and ADC internal connection (VADC), RINT1 must be included in the numerator term of the transfer function. See Table 30-53 in Section 30.0 “Electrical Characteristics” for the typical value of RINT1. Table 30-60 and Table 30-61 in Section 30.0 “Electrical Characteristics” describe the minimum Sample Time (TSAMP) requirements for the ADC module in this configuration. Figure 25-6 also defines the equations that should be used when calculating the expected voltages at points, VADC and VOAxOUT.

FIGURE 25-6: OP AMP CONFIGURATION A

25.1.2 OP AMP CONFIGURATION B

Figure 25-7 shows a typical inverting amplifier circuit with the output of the op amp (OAxOUT) externally routed to a separate analog input pin (ANy) on the device. This op amp configuration is slightly different in terms of the op amp output and the ADC input connection, therefore, RINT1 is not included in the transfer function. However, this configuration requires the designer to externally route the op amp output (OAxOUT) to another analog input pin (ANy). See Table 30-53 in Section 30.0 “Electrical Characteristics” for the typical value of RINT1.

Table 30-60 and Table 30-61 in Section 30.0 “Electrical Characteristics” describe the minimum Sample Time (TSAMP) requirements for the ADC module in this configuration.

Figure 25-7 also defines the equation to be used to calculate the expected voltage at point VOAxOUT. This is the typical inverting amplifier equation.

Table 25-1 is a summary of the availability of the comparators (1 to 4) and the op amp (1 to 3) for the different packages.

25.2 Op Amp/Comparator Resources

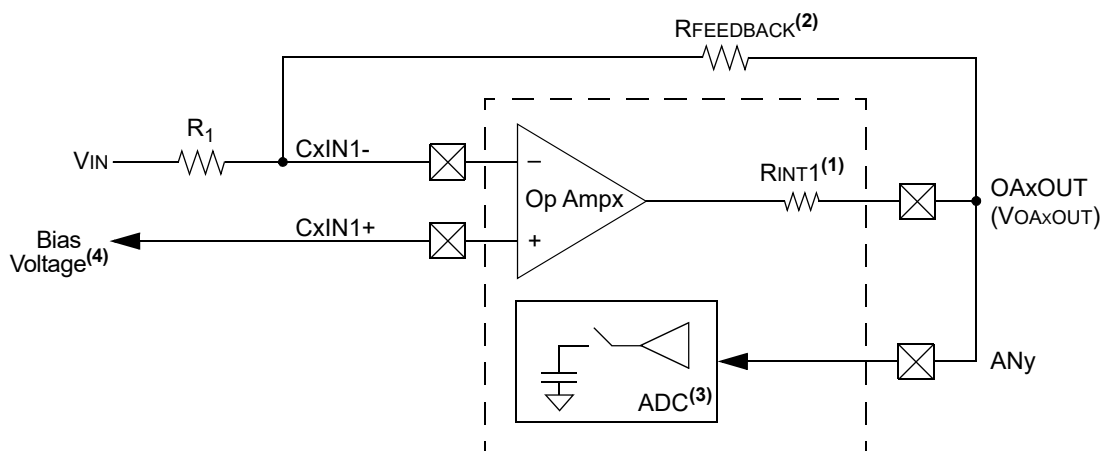

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this [link](http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464), contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464>

25.2.1 KEY RESOURCES

- “Op Amp/Comparator” (www.microchip.com/DS70000357) in the “dsPIC33/PIC24 Family Reference Manual”
- Code Samples
- Application Notes
- Software Libraries
- Webinars
- All Related “dsPIC33/PIC24 Family Reference Manual” Sections
- Development Tools

FIGURE 25-7: OP AMP CONFIGURATION B

$$V_{OAxOUT} = \left(\frac{R_{FEEDBACK}}{R_1} \right) (Bias\ Voltage - V_{IN})$$

- Note** 1: See [Table 30-53](#) for the Typical value.
 2: See [Table 30-53](#) for the Minimum value for the feedback resistor.
 3: See [Table 30-60](#) and [Table 30-61](#) for the minimum Sample Time (TSAMP).
 4: CVREF10 or CVREF20 are two options that are available for supplying bias voltage to the op amps.

0 = Voltage level is disconnected from then CVREF1O pin

bit 5 **CVRR:** Comparator Voltage Reference Range Selection bit

1 = CVRSRC/24 step-size

0 = CVRSRC/32 step-size

bit 4 **CVRSS:** Comparator Voltage Reference Source Selection bit⁽²⁾

1 = Comparator voltage reference source, CVRSRC = (VREF+) – (AVSS)

0 = Comparator voltage reference source, CVRSRC = AVDD – AVSS

bit 3-0 **CVR[3:0]** Comparator Voltage Reference Value Selection $0 \leq \text{CVR}[3:0] \leq 15$ bits

When CVRR = 1:

$\text{CVREFIN} = (\text{CVR}[3:0]/24) \cdot (\text{CVRSRC})$

When CVRR = 0:

$\text{CVREFIN} = (\text{CVRSRC}/4) + (\text{CVR}[3:0]/32) \cdot (\text{CVRSRC})$

Note 1: The ANSELx register controls the operation of the analog port pins. The port pins that are to function as analog inputs or outputs must have their corresponding ANSELx and TRISx bits set.

2: In order to operate with CVRSS = 1, at least one of the comparator modules must be enabled.

26.0 PROGRAMMABLE CYCLIC REDUNDANCY CHECK (CRC) GENERATOR

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Programmable Cyclic Redundancy Check (CRC)**” (www.microchip.com/DS70346) of the “dsPIC33/PIC24 Family Reference Manual”.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The programmable CRC generator offers the following features:

- User-Programmable (up to 32nd order) Polynomial CRC Equation
- Interrupt Output
- Data FIFO

The programmable CRC generator provides a hardware implemented method of quickly generating checksums for various networking and security applications. It offers the following features:

- User-Programmable CRC Polynomial Equation, Up to 32 Bits
- Programmable Shift Direction (little or big-endian)
- Independent Data and Polynomial Lengths
- Configurable Interrupt Output
- Data FIFO

A simplified block diagram of the CRC generator is shown in **Figure 26-1**. A simple version of the CRC shift engine is shown in **Figure 26-2**.

FIGURE 26-1: CRC BLOCK DIAGRAM

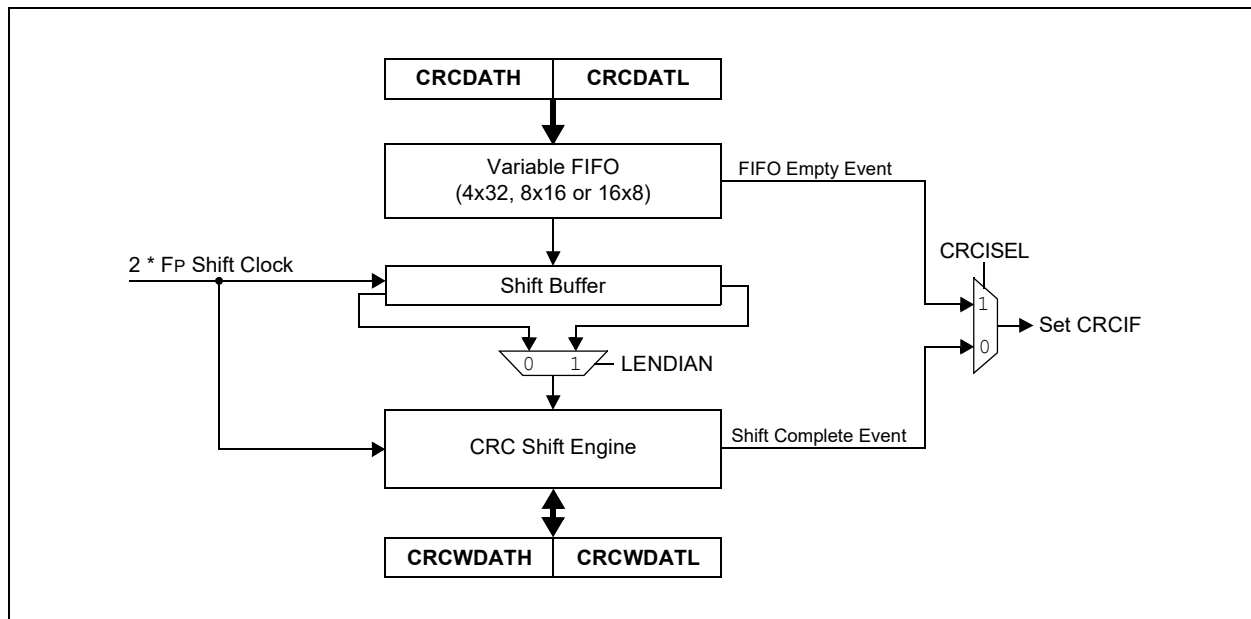

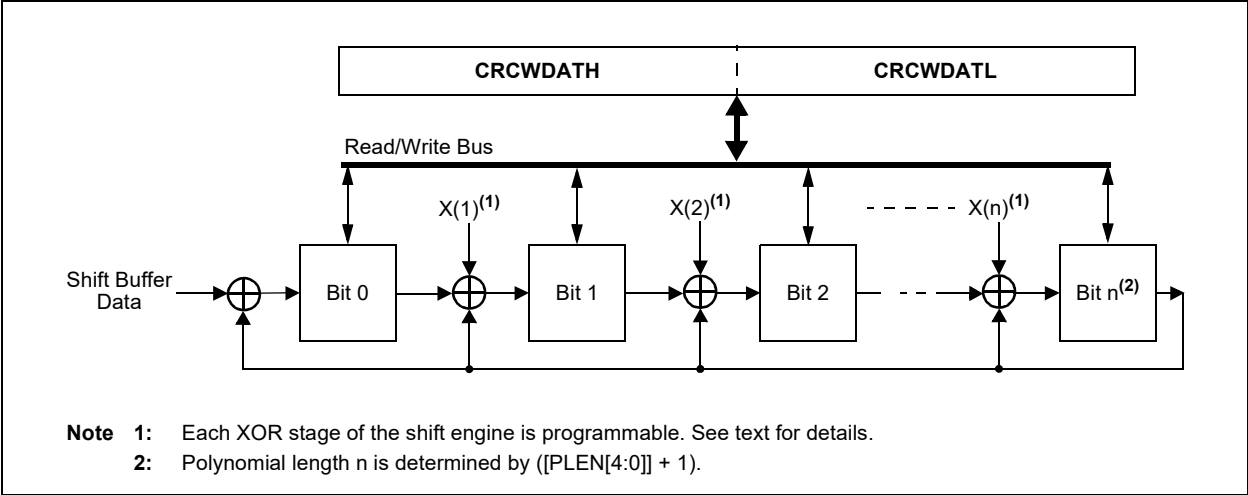

FIGURE 26-2: CRC SHIFT ENGINE DETAIL

26.1 Overview

The CRC module can be programmed for CRC polynomials of up to the 32nd order, using up to 32 bits. Polynomial length, which reflects the highest exponent in the equation, is selected by the PLEN[4:0] bits (CRCCON2[4:0]).

The CRCXORL and CRCXORH registers control which exponent terms are included in the equation. Setting a particular bit includes that exponent term in the equation; functionally, this includes an XOR operation on the corresponding bit in the CRC engine. Clearing the bit disables the XOR.

For example, consider two CRC polynomials, one a 16-bit equation and the other a 32-bit equation:

$$x^{16} + x^{12} + x^5 + 1$$

and

$$x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

To program these polynomials into the CRC generator, set the register bits as shown in Table 26-1.

Note that the appropriate positions are set to '1' to indicate that they are used in the equation (for example, X26 and X23). The 0 bit required by the equation is always XORed; thus, X0 is a don't care. For a polynomial of length N, it is assumed that the Nth bit will always be used, regardless of the bit setting. Therefore, for a polynomial length of 32, there is no 32nd bit in the CRCXOR register.

TABLE 26-1: CRC SETUP EXAMPLES FOR 16 AND 32-BIT POLYNOMIAL

| CRC Control Bits | Bit Values | |
|------------------|------------------------|------------------------|
| | 16-Bit Polynomial | 32-Bit Polynomial |
| PLEN[4:0] | 01111 | 11111 |
| X[31:16] | 0000 0000 0000 000x | 0000 0100 1100 0001 |
| X[15:0] | 0001 0000 0010 000x | 0001 1101 1011 011x |

26.2 Programmable CRC Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser:

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

- bit 15 **CRCEN:** CRC Enable bit
 1 = CRC module is enabled
 0 = CRC module is disabled; all state machines, pointers and CRCWDAT/CRCDAT are reset, other SFRs are not reset
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **CSIDL:** CRC Stop in Idle Mode bit
 1 = Discontinues module operation when device enters Idle mode
 0 = Continues module operation in Idle mode
- bit 12-8 **VWORD[4:0]:** Pointer Value bits
 Indicates the number of valid words in the FIFO. Has a maximum value of 8 when PLEN[4:0] > 7 or 16 when PLEN[4:0] ≤ 7.
- bit 7 **CRCFUL:** CRC FIFO Full bit
 1 = FIFO is full
 0 = FIFO is not full
- bit 6 **CRCMPT:** CRC FIFO Empty Bit
 1 = FIFO is empty
 0 = FIFO is not empty
- bit 5 **CRCISEL:** CRC Interrupt Selection bit
 1 = Interrupt on FIFO is empty; final word of data is still shifting through CRC
 0 = Interrupt on shift is complete and CRCWDAT results are ready
- bit 4 **CRCGO:** Start CRC bit
 1 = Starts CRC serial shifter
 0 = CRC serial shifter is turned off
- bit 3 **LENDIAN:** Data Word Little-Endian Configuration bit
 1 = Data word is shifted into the CRC starting with the LSb (little-endian)
 0 = Data word is shifted into the CRC starting with the MSb (big-endian)
- bit 2-0 **Unimplemented:** Read as '0'

NOTES:

27.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard™ Security
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation

27.1 Configuration Bits

In dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices, the Configuration bytes are implemented as volatile memory. This means that configuration data must be programmed each time the device is powered up. Configuration data are stored at the top of the on-chip program memory space, known as the Flash Configuration bytes. Their specific locations are shown in [Table 27-1](#). The configuration data are automatically loaded from the Flash Configuration bytes to the proper Configuration Shadow registers during device Resets.

Note: Configuration data are reloaded on all types of device Resets.

When creating applications for these devices, users should always specifically allocate the location of the Flash Configuration bytes for configuration data in their code for the compiler. This is to make certain that program code is not stored in this address when the code is compiled.

The upper 2 bytes of all Flash Configuration Words in program memory should always be ‘1111 1111 1111 1111’. This makes them appear to be NOP instructions in the remote event that their locations are ever executed by accident. Since Configuration bits are not implemented in the corresponding locations, writing ‘1’s to these locations has no effect on device operation.

Note: Performing a page erase operation on the last page of program memory clears the Flash Configuration bytes, enabling code protection as a result. Therefore, users should avoid performing page erase operations on the last page of program memory.

The Configuration Flash bytes map is shown in [Table 27-1](#).

Note 1: This bit is only available on dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices.

2: This bit is reserved and must be programmed as '0'.

3: These bits are reserved and must be programmed as '1'.

TABLE 27-2: CONFIGURATION BITS DESCRIPTION

| Bit Field | Description |
|------------------------|--|
| GCP | General Segment Code-Protect bit 1 = User program memory is not code-protected 0 = Code protection is enabled for the entire program memory space |
| GWRP | General Segment Write-Protect bit 1 = User program memory is not write-protected 0 = User program memory is write-protected |
| IESO | Two-Speed Oscillator Start-up Enable bit 1 = Start up device with FRC, then automatically switch to the user-selected oscillator source when ready 0 = Start up device with user-selected oscillator source |
| PWMLOCK ⁽¹⁾ | PWM Lock Enable bit 1 = Certain PWM registers may only be written after a key sequence 0 = PWM registers may be written without a key sequence |
| FNOSC[2:0] | Oscillator Selection bits 111 = Fast RC Oscillator with Divide-by-N (FRCDIVN) 110 = Reserved; do not use 101 = Low-Power RC Oscillator (LPRC) 100 = Reserved; do not use 011 = Primary Oscillator with PLL module (XT + PLL, HS + PLL, EC + PLL) 010 = Primary Oscillator (XT, HS, EC) 001 = Fast RC Oscillator with Divide-by-N with PLL module (FRCPLL) 000 = Fast RC Oscillator (FRC) |
| FCKSM[1:0] | Clock Switching Mode bits 1x = Clock switching is disabled, Fail-Safe Clock Monitor is disabled 01 = Clock switching is enabled, Fail-Safe Clock Monitor is disabled 00 = Clock switching is enabled, Fail-Safe Clock Monitor is enabled |
| IOL1WAY | Peripheral Pin Select Configuration bit 1 = Allow only one reconfiguration 0 = Allow multiple reconfigurations |
| OSCIOFNC | OSC2 Pin Function bit (except in XT and HS modes) 1 = OSC2 is the clock output 0 = OSC2 is a general purpose digital I/O pin |
| POSCMD[1:0] | Primary Oscillator Mode Select bits 11 = Primary Oscillator is disabled 10 = HS Crystal Oscillator mode 01 = XT Crystal Oscillator mode 00 = EC (External Clock) mode |
| FWDTEN | Watchdog Timer Enable bit 1 = Watchdog Timer is always enabled (LPRC Oscillator cannot be disabled. Clearing the SWDTEN bit in the RCON register will have no effect.) 0 = Watchdog Timer is enabled/disabled by user software (LPRC can be disabled by clearing the SWDTEN bit in the RCON register) |
| WINDIS | Watchdog Timer Window Enable bit 1 = Watchdog Timer in Non-Window mode 0 = Watchdog Timer in Window mode |
| PLLKEN | PLL Lock Enable bit 1 = PLL lock is enabled 0 = PLL lock is disabled |

Note 1: This bit is only available on dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices.

2: When JTAGEN = 1, an internal pull-up resistor is enabled on the TMS pin. Erased devices default to JTAGEN = 1. Applications requiring I/O pins in a high-impedance state (tri-state) in Reset should use pins other than TMS for this purpose.

TABLE 27-2: CONFIGURATION BITS DESCRIPTION (CONTINUED)

| Bit Field | Description |
|-----------------------|---|
| WDTPRE | Watchdog Timer Prescaler bit 1 = 1:128 0 = 1:32 |
| WDTPOST[3:0] | Watchdog Timer Postscaler bits 1111 = 1:32,768 1110 = 1:16,384 • • • 0001 = 1:2 0000 = 1:1 |
| WDTWIN[1:0] | Watchdog Window Select bits 11 = WDT window is 25% of WDT period 10 = WDT window is 37.5% of WDT period 01 = WDT window is 50% of WDT period 00 = WDT window is 75% of WDT period |
| ALTI2C1 | Alternate I2C1 pin 1 = I2C1 is mapped to the SDA1/SCL1 pins 0 = I2C1 is mapped to the ASDA1/ASCL1 pins |
| ALTI2C2 | Alternate I2C2 pin 1 = I2C2 is mapped to the SDA2/SCL2 pins 0 = I2C2 is mapped to the ASDA2/ASCL2 pins |
| JTAGEN ⁽²⁾ | JTAG Enable bit 1 = JTAG is enabled 0 = JTAG is disabled |
| ICS[1:0] | ICD Communication Channel Select bits 11 = Communicate on PGEC1 and PGED1 10 = Communicate on PGEC2 and PGED2 01 = Communicate on PGEC3 and PGED3 00 = Reserved, do not use |

Note 1: This bit is only available on dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices.

2: When JTAGEN = 1, an internal pull-up resistor is enabled on the TMS pin. Erased devices default to JTAGEN = 1. Applications requiring I/O pins in a high-impedance state (tri-state) in Reset should use pins other than TMS for this purpose.

 0000 = 1:1

27.2 User ID Words

dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices contain four User ID Words, located at addresses, 0x800FF8 through 0x800FFE. The User ID Words can be used for storing product information such as serial numbers, system manufacturing dates, manufacturing lot numbers and other application-specific information.

The User ID Words register map is shown in Table 27-3.

TABLE 27-3: USER ID WORDS REGISTER MAP

| File Name | Address | Bits 23-16 | Bits 15-0 |
|-----------|----------|------------|-----------|
| FUID0 | 0x800FF8 | — | UID0 |
| FUID1 | 0x800FFA | — | UID1 |
| FUID2 | 0x800FFC | — | UID2 |
| FUID3 | 0x800FFE | — | UID3 |

Legend: — = unimplemented, read as '1'.

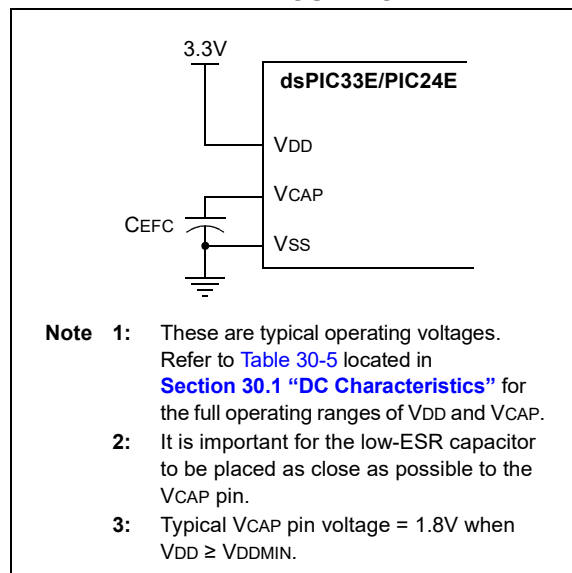

27.3 On-Chip Voltage Regulator

All of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices power their core digital logic at a nominal 1.8V. This can create a conflict for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator provides power to the core from the other VDD pins. A low-ESR (less than 1 Ohm) capacitor (such as tantalum or ceramic) must be connected to the VCAP pin (Figure 27-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in Table 30-5 located in Section 30.0 “Electrical Characteristics”.

Note: It is important for the low-ESR capacitor to be placed as close as possible to the VCAP pin.

FIGURE 27-1: CONNECTIONS FOR THE ON-CHIP VOLTAGE REGULATOR^(1,2,3)

27.4 Brown-out Reset (BOR)

The Brown-out Reset (BOR) module is based on an internal voltage reference circuit that monitors the regulated supply voltage, VCAP. The main purpose of the BOR module is to generate a device Reset when a brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse, which resets the device. The BOR selects the clock source, based on the device Configuration bit values (FNOSC[2:0] and POSCMD[1:0]).

If an oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON[5]) is '1'.

Concurrently, the PWRT Time-out (TPWRT) is applied before the internal Reset is released. If TPWRT = 0 and a crystal oscillator is being used, then a nominal delay of TFSCM is applied. The total delay in this case is TFSCM. Refer to Parameter SY35 in Table 30-22 of Section 30.0 “Electrical Characteristics” for specific TFSCM values.

The BOR status bit (RCON[1]) is set to indicate that a BOR has occurred. The BOR circuit continues to operate while in Sleep or Idle modes and resets the device should VDD fall below the BOR threshold voltage.

27.5 Watchdog Timer (WDT)

For dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices, the WDT is driven by the LPRC Oscillator. When the WDT is enabled, the clock source is also enabled.

27.5.1 PRESCALER/POSTSCALER

The nominal WDT clock source from LPRC is 32 kHz. This feeds a prescaler that can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the WDTPRE Configuration bit. With a 32 kHz input, the prescaler yields a WDT Time-out period (TWDT), as shown in Parameter SY12 in Table 30-22.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPOST[3:0] Configuration bits (FWDT[3:0]), which allow the selection of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler, time-out periods ranging from 1 ms to 131 seconds can be achieved.

The WDT, prescaler and postscaler are reset:

- On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSCx bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

Note: The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

27.5.2 SLEEP AND IDLE MODES

If the WDT is enabled, it continues to run during Sleep or Idle modes. When the WDT time-out occurs, the device wakes the device and code execution continues from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bit (RCON[3,2]) needs to be cleared in software after the device wakes up.

27.5.3 ENABLING WDT

The WDT is enabled or disabled by the FWDTEN Configuration bit in the FWDT Configuration register. When the FWDTEN Configuration bit is set, the WDT is always enabled.

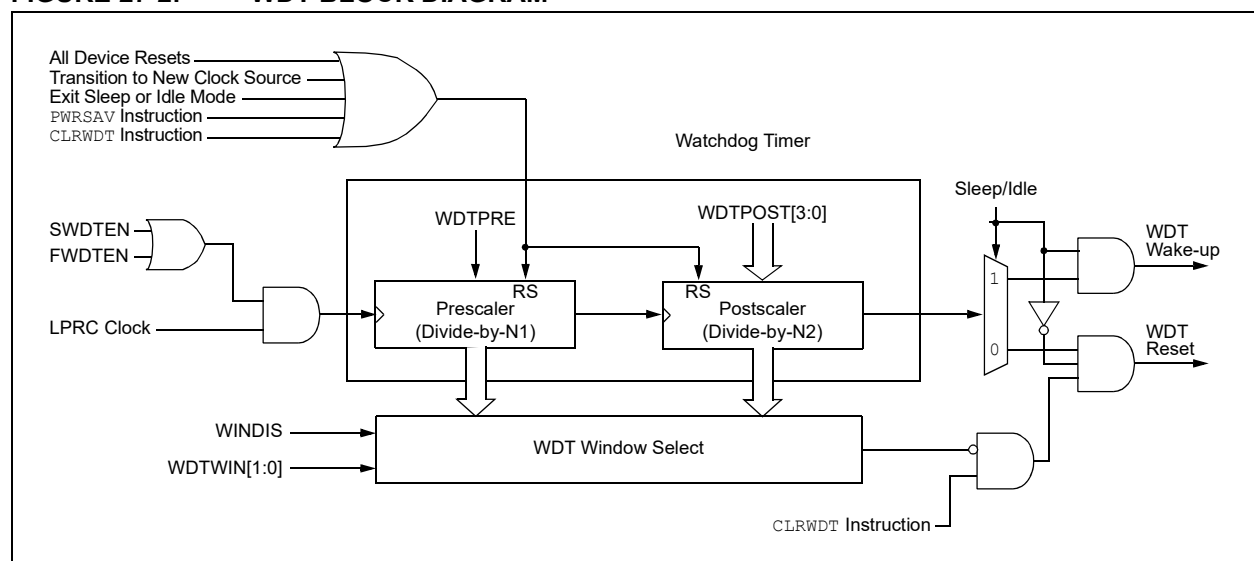

The WDT can be optionally controlled in software when the FWDTEN Configuration bit has been programmed to '0'. The WDT is enabled in software by setting the SWDTEN control bit (RCON[5]). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user application to enable the WDT for critical code segments and disable the WDT during non-critical segments for maximum power savings.

The WDT flag bit, WDTO (RCON[4]), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

27.5.4 WDT WINDOW

The Watchdog Timer has an optional Windowed mode, enabled by programming the WINDIS bit in the WDT Configuration register (FWDT[6]). In the Windowed mode (WINDIS = 0), the WDT should be cleared based on the settings in the programmable Watchdog Timer Window select bits (WDTWIN[1:0]).

FIGURE 27-2: WDT BLOCK DIAGRAM

27.6 JTAG Interface

dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices implement a JTAG interface, which supports boundary scan device testing. Detailed information on this interface is provided in future revisions of the document.

Note: Refer to “Programming and Diagnostics” (www.microchip.com/DS70608) in the “dsPIC33/PIC24 Family Reference Manual” for further information on usage, configuration and operation of the JTAG interface.

27.7 In-Circuit Serial Programming

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices can be serially programmed while in the end application circuit. This is done with two lines for clock and data, and three other lines for power, ground and the programming sequence. Serial programming allows customers to manufacture boards with unprogrammed devices and then program the device just before shipping the product. Serial programming also allows the most recent firmware or a custom firmware to be programmed. Refer to the “dsPIC33E/PIC24E Flash Programming Specification for Devices with Volatile Configuration Bits” (DS70663) for details about In-Circuit Serial Programming (ICSP).

Any of the three pairs of programming clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

27.8 In-Circuit Debugger

When MPLAB® ICD 3 or REAL ICE™ is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx (Emulation/Debug Clock) and PGEDx (Emulation/Debug Data) pin functions.

Any of the three pairs of debugging clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to MCLR, VDD, VSS and the PGECx/PGEDx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins (PGECx and PGEDx).

27.9 Code Protection and CodeGuard™ Security

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X, and PIC24EPXXXGP/MC20X devices offer basic implementation of CodeGuard Security that supports only General Segment (GS) security. This feature helps protect individual Intellectual Property.

Note: Refer to “CodeGuard™ Security” (www.microchip.com/DS70634) in the “dsPIC33/PIC24 Family Reference Manual” for further information on usage, configuration and operation of CodeGuard Security.

28.0 INSTRUCTION SET SUMMARY

Note: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

The dsPIC33EP instruction set is almost identical to that of the dsPIC30F and dsPIC33F. The PIC24EP instruction set is almost identical to that of the PIC24F and PIC24H.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 28-1 lists the general symbols used in describing the instructions.

The dsPIC33E instruction set summary in Table 28-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register ‘Wb’ without any address modifier
- The second source operand, which is typically a register ‘Ws’ with or without an address modifier
- The destination of the result, which is typically a register ‘Wd’ with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value ‘f’
- The destination, which could be either the file register ‘f’ or the W0 register, which is denoted as ‘WREG’

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of ‘Ws’ or ‘f’)
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register ‘Wb’)

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by ‘k’)
- The W register or file register where the literal value is to be loaded (specified by ‘Wb’ or ‘f’)

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register ‘Wb’ without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register ‘Wd’ with or without an address modifier

The MAC class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- The accumulator write back destination

The other DSP instructions do not involve any multiplication and can include:

- The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register ‘Wn’ or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the Table Read and Table Write instructions

Most instructions are a single word. Certain double-word instructions are designed to provide all the required information in these 48 bits. In the second word, the 8 MSBs are '0's. If this second word is executed as an instruction (by itself), it executes as a NOP.

The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true, or the Program Counter is changed as a result of the instruction, or a PSV or Table Read is performed, or an SFR register is read. In these cases, the execution takes multiple instruction cycles with the additional instruction cycle(s) executed as a NOP. Certain instructions that involve skipping over the subsequent instruction require either

two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

Note: For more details on the instruction set, refer to the *"16-Bit MCU and DSC Programmer's Reference Manual"* (www.microchip.com/DS70000157).

For more information on instructions that take more than one instruction cycle to execute, refer to **"CPU"** (www.microchip.com/DS70359) in the *"dsPIC33/PIC24 Family Reference Manual"*, particularly the **"Instruction Flow Types"** section.

TABLE 28-1: SYMBOLS USED IN OPCODE DESCRIPTIONS

| Field | Description |
|---------------------|---|
| #text | Means literal defined by "text" |
| (text) | Means "content of text" |
| [text] | Means "the location addressed by text" |
| { } | Optional field or operation |
| $a \in \{b, c, d\}$ | a is selected from the set of values b, c, d |
| [n:m] | Register bit field |
| .b | Byte mode selection |
| .d | Double-Word mode selection |
| .S | Shadow register select |
| .w | Word mode selection (default) |
| Acc | One of two accumulators {A, B} |
| AWB | Accumulator write back destination address register $\in \{W13, [W13]+ = 2\}$ |
| bit4 | 4-bit bit selection field (used in word addressed instructions) $\in \{0...15\}$ |
| C, DC, N, OV, Z | MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero |
| Expr | Absolute address, label or expression (resolved by the linker) |
| f | File register address $\in \{0x0000...0x1FFF\}$ |
| lit1 | 1-bit unsigned literal $\in \{0,1\}$ |
| lit4 | 4-bit unsigned literal $\in \{0...15\}$ |
| lit5 | 5-bit unsigned literal $\in \{0...31\}$ |
| lit8 | 8-bit unsigned literal $\in \{0...255\}$ |
| lit10 | 10-bit unsigned literal $\in \{0...255\}$ for Byte mode, $\{0:1023\}$ for Word mode |
| lit14 | 14-bit unsigned literal $\in \{0...16384\}$ |
| lit16 | 16-bit unsigned literal $\in \{0...65535\}$ |
| lit23 | 23-bit unsigned literal $\in \{0...8388608\}$; LSb must be '0' |
| None | Field does not require an entry, can be blank |
| OA, OB, SA, SB | DSP Status bits: ACCA Overflow, ACCB Overflow, ACCA Saturate, ACCB Saturate |
| PC | Program Counter |
| Slit10 | 10-bit signed literal $\in \{-512...511\}$ |
| Slit16 | 16-bit signed literal $\in \{-32768...32767\}$ |
| Slit6 | 6-bit signed literal $\in \{-16...16\}$ |
| Wb | Base W register $\in \{W0...W15\}$ |
| Wd | Destination W register $\in \{Wd, [Wd], [Wd++], [Wd--], [++Wd], [--Wd]\}$ |
| Wdo | Destination W register $\in \{Wnd, [Wnd], [Wnd++], [Wnd--], [++Wnd], [--Wnd], [Wnd+Wb]\}$ |

TABLE 28-1: SYMBOLS USED IN OPCODE DESCRIPTIONS (CONTINUED)

| Field | Description |
|-------|---|
| Wm,Wn | Dividend, Divisor Working register pair (direct addressing) |
| Wm*Wm | Multiplicand and Multiplier Working register pair for Square instructions $\in \{W4 * W4, W5 * W5, W6 * W6, W7 * W7\}$ |
| Wm*Wn | Multiplicand and Multiplier Working register pair for DSP instructions $\in \{W4 * W5, W4 * W6, W4 * W7, W5 * W6, W5 * W7, W6 * W7\}$ |
| Wn | One of 16 Working registers $\in \{W0...W15\}$ |
| Wnd | One of 16 destination Working registers $\in \{W0...W15\}$ |
| Wns | One of 16 source Working registers $\in \{W0...W15\}$ |
| WREG | W0 (Working register used in file register instructions) |
| Ws | Source W register $\in \{Ws, [Ws], [Ws++] , [Ws--], [++Ws], [--Ws] \}$ |
| Wso | Source W register $\in \{Wns, [Wns], [Wns++] , [Wns--], [++Wns], [--Wns], [Wns+Wb] \}$ |
| Wx | X Data Space Prefetch Address register for DSP instructions $\in \{[W8] + = 6, [W8] + = 4, [W8] + = 2, [W8], [W8] - = 6, [W8] - = 4, [W8] - = 2, [W9] + = 6, [W9] + = 4, [W9] + = 2, [W9], [W9] - = 6, [W9] - = 4, [W9] - = 2, [W9 + W12], \text{none}\}$ |
| Wxd | X Data Space Prefetch Destination register for DSP instructions $\in \{W4...W7\}$ |
| Wy | Y Data Space Prefetch Address register for DSP instructions $\in \{[W10] + = 6, [W10] + = 4, [W10] + = 2, [W10], [W10] - = 6, [W10] - = 4, [W10] - = 2, [W11] + = 6, [W11] + = 4, [W11] + = 2, [W11], [W11] - = 6, [W11] - = 4, [W11] - = 2, [W11 + W12], \text{none}\}$ |
| Wyd | Y Data Space Prefetch Destination register for DSP instructions $\in \{W4...W7\}$ |

TABLE 28-2: INSTRUCTION SET OVERVIEW

| Base Instr # | Assembly Mnemonic | Assembly Syntax | Description | # of Words | # of Cycles ⁽²⁾ | Status Flags Affected |
|--------------|-------------------|-----------------------------|--|------------|----------------------------|-----------------------|
| 1 | ADD | ADD Acc ⁽¹⁾ | Add Accumulators | 1 | 1 | OA,OB,SA,SB |
| | | ADD f | f = f + WREG | 1 | 1 | C,DC,N,OV,Z |
| | | ADD f, WREG | WREG = f + WREG | 1 | 1 | C,DC,N,OV,Z |
| | | ADD #lit10, Wn | Wd = lit10 + Wd | 1 | 1 | C,DC,N,OV,Z |
| | | ADD Wb, Ws, Wd | Wd = Wb + Ws | 1 | 1 | C,DC,N,OV,Z |
| | | ADD Wb, #lit5, Wd | Wd = Wb + lit5 | 1 | 1 | C,DC,N,OV,Z |
| 2 | ADDC | ADDC Wso, #Slit4, Acc | 16-bit Signed Add to Accumulator | 1 | 1 | OA,OB,SA,SB |
| | | ADDC f | f = f + WREG + (C) | 1 | 1 | C,DC,N,OV,Z |
| | | ADDC f, WREG | WREG = f + WREG + (C) | 1 | 1 | C,DC,N,OV,Z |
| | | ADDC #lit10, Wn | Wd = lit10 + Wd + (C) | 1 | 1 | C,DC,N,OV,Z |
| | | ADDC Wb, Ws, Wd | Wd = Wb + Ws + (C) | 1 | 1 | C,DC,N,OV,Z |
| 3 | AND | AND Wb, #lit5, Wd | Wd = Wb + lit5 + (C) | 1 | 1 | C,DC,N,OV,Z |
| | | AND f | f = f .AND. WREG | 1 | 1 | N,Z |
| | | AND f, WREG | WREG = f .AND. WREG | 1 | 1 | N,Z |
| | | AND #lit10, Wn | Wd = lit10 .AND. Wd | 1 | 1 | N,Z |
| | | AND Wb, Ws, Wd | Wd = Wb .AND. Ws | 1 | 1 | N,Z |
| 4 | ASR | AND Wb, #lit5, Wd | Wd = Wb .AND. lit5 | 1 | 1 | N,Z |
| | | ASR f | f = Arithmetic Right Shift f | 1 | 1 | C,N,OV,Z |
| | | ASR f, WREG | WREG = Arithmetic Right Shift f | 1 | 1 | C,N,OV,Z |
| | | ASR Ws, Wd | Wd = Arithmetic Right Shift Ws | 1 | 1 | C,N,OV,Z |
| | | ASR Wb, Wns, Wnd | Wnd = Arithmetic Right Shift Wb by Wns | 1 | 1 | N,Z |
| 5 | BCLR | ASR Wb, #lit5, Wnd | Wnd = Arithmetic Right Shift Wb by lit5 | 1 | 1 | N,Z |
| | | BCLR f, #bit4 | Bit Clear f | 1 | 1 | None |
| 6 | BRA | BCLR Ws, #bit4 | Bit Clear Ws | 1 | 1 | None |
| | | BRA C, Expr | Branch if Carry | 1 | 1 (4) | None |
| | | BRA GE, Expr | Branch if Greater Than or Equal | 1 | 1 (4) | None |
| | | BRA GEU, Expr | Branch if Unsigned Greater Than or Equal | 1 | 1 (4) | None |
| | | BRA GT, Expr | Branch if Greater Than | 1 | 1 (4) | None |
| | | BRA GTU, Expr | Branch if Unsigned Greater Than | 1 | 1 (4) | None |
| | | BRA LE, Expr | Branch if Less Than or Equal | 1 | 1 (4) | None |
| | | BRA LEU, Expr | Branch if Unsigned Less Than or Equal | 1 | 1 (4) | None |
| | | BRA LT, Expr | Branch if Less Than | 1 | 1 (4) | None |
| | | BRA LTU, Expr | Branch if Unsigned Less Than | 1 | 1 (4) | None |
| | | BRA N, Expr | Branch if Negative | 1 | 1 (4) | None |
| | | BRA NC, Expr | Branch if Not Carry | 1 | 1 (4) | None |
| | | BRA NN, Expr | Branch if Not Negative | 1 | 1 (4) | None |
| | | BRA NOV, Expr | Branch if Not Overflow | 1 | 1 (4) | None |
| | | BRA NZ, Expr | Branch if Not Zero | 1 | 1 (4) | None |
| | | BRA OA, Expr ⁽¹⁾ | Branch if Accumulator A overflow | 1 | 1 (4) | None |
| | | BRA OB, Expr ⁽¹⁾ | Branch if Accumulator B overflow | 1 | 1 (4) | None |
| | | BRA OV, Expr ⁽¹⁾ | Branch if Overflow | 1 | 1 (4) | None |
| | | BRA SA, Expr ⁽¹⁾ | Branch if Accumulator A saturated | 1 | 1 (4) | None |
| | | BRA SB, Expr ⁽¹⁾ | Branch if Accumulator B saturated | 1 | 1 (4) | None |
| | | BRA Expr | Branch Unconditionally | 1 | 4 | None |
| | | BRA Z, Expr | Branch if Zero | 1 | 1 (4) | None |
| | | BRA Wn | Computed Branch | 1 | 4 | None |
| 7 | BSET | BSET f, #bit4 | Bit Set f | 1 | 1 | None |
| | | BSET Ws, #bit4 | Bit Set Ws | 1 | 1 | None |
| 8 | BSW | BSW.C Ws, Wb | Write C bit to Ws[Wb] | 1 | 1 | None |
| | | BSW.Z Ws, Wb | Write Z bit to Ws[Wb] | 1 | 1 | None |

Note 1: These instructions are available in dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices only.

2: Read and Read-Modify-Write (e.g., bit operations and logical operations) on non-CPU SFRs incur an additional instruction cycle.

TABLE 28-2: INSTRUCTION SET OVERVIEW (CONTINUED)

| Base Instr # | Assembly Mnemonic | Assembly Syntax | Description | # of Words | # of Cycles ⁽²⁾ | Status Flags Affected |
|--------------|-------------------|--|---|------------|----------------------------|-----------------------|
| 9 | BTG | BTG <i>f</i> , #bit4 | Bit Toggle <i>f</i> | 1 | 1 | None |
| | | BTG <i>Ws</i> , #bit4 | Bit Toggle <i>Ws</i> | 1 | 1 | None |
| 10 | BTSC | BTSC <i>f</i> , #bit4 | Bit Test <i>f</i> , Skip if Clear | 1 | 1 (2 or 3) | None |
| | | BTSC <i>Ws</i> , #bit4 | Bit Test <i>Ws</i> , Skip if Clear | 1 | 1 (2 or 3) | None |
| 11 | BTSS | BTSS <i>f</i> , #bit4 | Bit Test <i>f</i> , Skip if Set | 1 | 1 (2 or 3) | None |
| | | BTSS <i>Ws</i> , #bit4 | Bit Test <i>Ws</i> , Skip if Set | 1 | 1 (2 or 3) | None |
| 12 | BTST | BTST <i>f</i> , #bit4 | Bit Test <i>f</i> | 1 | 1 | Z |
| | | BTST.C <i>Ws</i> , #bit4 | Bit Test <i>Ws</i> to C | 1 | 1 | C |
| | | BTST.Z <i>Ws</i> , #bit4 | Bit Test <i>Ws</i> to Z | 1 | 1 | Z |
| | | BTST.C <i>Ws</i> , <i>Wb</i> | Bit Test <i>Ws</i> [<i>Wb</i>] to C | 1 | 1 | C |
| | | BTST.Z <i>Ws</i> , <i>Wb</i> | Bit Test <i>Ws</i> [<i>Wb</i>] to Z | 1 | 1 | Z |
| 13 | BTSTS | BTSTS <i>f</i> , #bit4 | Bit Test then Set <i>f</i> | 1 | 1 | Z |
| | | BTSTS.C <i>Ws</i> , #bit4 | Bit Test <i>Ws</i> to C, then Set | 1 | 1 | C |
| | | BTSTS.Z <i>Ws</i> , #bit4 | Bit Test <i>Ws</i> to Z, then Set | 1 | 1 | Z |
| 14 | CALL | CALL <i>lit</i> 23 | Call Subroutine | 2 | 4 | SFA |
| | | CALL <i>Wn</i> | Call Indirect Subroutine | 1 | 4 | SFA |
| | | CALL.L <i>Wn</i> | Call Indirect Subroutine (long address) | 1 | 4 | SFA |
| 15 | CLR | CLR <i>f</i> | <i>f</i> = 0x0000 | 1 | 1 | None |
| | | CLR WREG | WREG = 0x0000 | 1 | 1 | None |
| | | CLR <i>Ws</i> | <i>Ws</i> = 0x0000 | 1 | 1 | None |
| | | CLR <i>Acc</i> , <i>Wx</i> , <i>Wxd</i> , <i>Wy</i> , <i>Wyd</i> , <i>AWB</i> ⁽¹⁾ | Clear Accumulator | 1 | 1 | OA, OB, SA, SB |
| 16 | CLRWDT | CLRWDT | Clear Watchdog Timer | 1 | 1 | WDTO, Sleep |
| 17 | COM | COM <i>f</i> | <i>f</i> = \bar{f} | 1 | 1 | N, Z |
| | | COM <i>f</i> , WREG | WREG = \bar{f} | 1 | 1 | N, Z |
| | | COM <i>Ws</i> , <i>Wd</i> | <i>Wd</i> = \overline{Ws} | 1 | 1 | N, Z |
| 18 | CP | CP <i>f</i> | Compare <i>f</i> with WREG | 1 | 1 | C, DC, N, OV, Z |
| | | CP <i>Wb</i> , #lit8 | Compare <i>Wb</i> with lit8 | 1 | 1 | C, DC, N, OV, Z |
| | | CP <i>Wb</i> , <i>Ws</i> | Compare <i>Wb</i> with <i>Ws</i> (<i>Wb</i> – <i>Ws</i>) | 1 | 1 | C, DC, N, OV, Z |
| 19 | CP0 | CP0 <i>f</i> | Compare <i>f</i> with 0x0000 | 1 | 1 | C, DC, N, OV, Z |
| | | CP0 <i>Ws</i> | Compare <i>Ws</i> with 0x0000 | 1 | 1 | C, DC, N, OV, Z |
| 20 | CPB | CPB <i>f</i> | Compare <i>f</i> with WREG, with Borrow | 1 | 1 | C, DC, N, OV, Z |
| | | CPB <i>Wb</i> , #lit8 | Compare <i>Wb</i> with lit8, with Borrow | 1 | 1 | C, DC, N, OV, Z |
| | | CPB <i>Wb</i> , <i>Ws</i> | Compare <i>Wb</i> with <i>Ws</i> , with Borrow (<i>Wb</i> – <i>Ws</i> – C) | 1 | 1 | C, DC, N, OV, Z |
| 21 | CPSEQ | CPSEQ <i>Wb</i> , <i>Wn</i> | Compare <i>Wb</i> with <i>Wn</i> , Skip if = | 1 | 1 (2 or 3) | None |
| | CPBEQ | CPBEQ <i>Wb</i> , <i>Wn</i> , <i>Expr</i> | Compare <i>Wb</i> with <i>Wn</i> , Branch if = | 1 | 1 (5) | None |

| | | MUL.UU $Wb, \#lit5, Wnd$ | $\{Wnd + 1, Wnd\} = \text{unsigned}(Wb) * \text{unsigned}(lit5)$ | 1 | 1 | None |
| | | MUL.UU $Wb, \#lit5, Wnd$ | $Wnd = \text{unsigned}(Wb) * \text{unsigned}(lit5)$ | 1 | 1 | None |
| | | MUL f | $W3:W2 = f * WREG$ | 1 | 1 | None |

Note 1: These instructions are available in dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices only.

2: Read and Read-Modify-Write (e.g., bit operations and logical operations) on non-CPU SFRs incur an additional instruction cycle.

TABLE 28-2: INSTRUCTION SET OVERVIEW (CONTINUED)

| Base Instr # | Assembly Mnemonic | Assembly Syntax | Description | # of Words | # of Cycles ⁽²⁾ | Status Flags Affected |
|--------------|-------------------|---------------------------------|--|------------|----------------------------|-----------------------|
| 53 | NEG | NEG $Acc^{(1)}$ | Negate Accumulator | 1 | 1 | OA,OB,OAB,SA,SB,SAB |
| | | NEG f | $f = \bar{f} + 1$ | 1 | 1 | C,DC,N,OV,Z |
| | | NEG $f, WREG$ | $WREG = \bar{f} + 1$ | 1 | 1 | C,DC,N,OV,Z |
| | | NEG Ws, Wd | $Wd = \bar{Ws} + 1$ | 1 | 1 | C,DC,N,OV,Z |
| 54 | NOP | NOP | No Operation | 1 | 1 | None |
| | | NOPR | No Operation | 1 | 1 | None |
| 55 | POP | POP f | Pop f from Top-of-Stack (TOS) | 1 | 1 | None |
| | | POP Wdo | Pop from Top-of-Stack (TOS) to Wdo | 1 | 1 | None |
| | | POP.D Wnd | Pop from Top-of-Stack (TOS) to $W(nd):W(nd + 1)$ | 1 | 2 | None |
| | | POP.S | Pop Shadow Registers | 1 | 1 | All |
| 56 | PUSH | PUSH f | Push f to Top-of-Stack (TOS) | 1 | 1 | None |
| | | PUSH Wso | Push Wso to Top-of-Stack (TOS) | 1 | 1 | None |
| | | PUSH.D Wns | Push $W(ns):W(ns + 1)$ to Top-of-Stack (TOS) | 1 | 2 | None |
| | | PUSH.S | Push Shadow Registers | 1 | 1 | None |
| 57 | PWRSV | PWRSV $\#lit1$ | Go into Sleep or Idle mode | 1 | 1 | WDT0,Sleep |
| 58 | RCALL | RCALL $Expr$ | Relative Call | 1 | 4 | SFA |
| | | RCALL Wn | Computed Call | 1 | 4 | SFA |
| 59 | REPEAT | REPEAT $\#lit15$ | Repeat Next Instruction $lit15 + 1$ Times | 1 | 1 | None |
| | | REPEAT Wn | Repeat Next Instruction (Wn) + 1 Times | 1 | 1 | None |
| 60 | RESET | RESET | Software Device Reset | 1 | 1 | None |
| 61 | RETFIE | RETFIE | Return from Interrupt | 1 | 6 (5) | SFA |
| 62 | RETLW | RETLW $\#lit10, Wn$ | Return with Literal in Wn | 1 | 6 (5) | SFA |
| 63 | RETURN | RETURN | Return from Subroutine | 1 | 6 (5) | SFA |
| 64 | RLC | RLC f | $f = \text{Rotate Left through Carry } f$ | 1 | 1 | C,N,Z |
| | | RLC $f, WREG$ | $WREG = \text{Rotate Left through Carry } f$ | 1 | 1 | C,N,Z |
| | | RLC Ws, Wd | $Wd = \text{Rotate Left through Carry } Ws$ | 1 | 1 | C,N,Z |
| 65 | RLNC | RLNC f | $f = \text{Rotate Left (No Carry) } f$ | 1 | 1 | N,Z |
| | | RLNC $f, WREG$ | $WREG = \text{Rotate Left (No Carry) } f$ | 1 | 1 | N,Z |
| | | RLNC Ws, Wd | $Wd = \text{Rotate Left (No Carry) } Ws$ | 1 | 1 | N,Z |
| 66 | RRC | RRC f | $f = \text{Rotate Right through Carry } f$ | 1 | 1 | C,N,Z |
| | | RRC $f, WREG$ | $WREG = \text{Rotate Right through Carry } f$ | 1 | 1 | C,N,Z |
| | | RRC Ws, Wd | $Wd = \text{Rotate Right through Carry } Ws$ | 1 | 1 | C,N,Z |
| 67 | RRNC | RRNC f | $f = \text{Rotate Right (No Carry) } f$ | 1 | 1 | N,Z |
| | | RRNC $f, WREG$ | $WREG = \text{Rotate Right (No Carry) } f$ | 1 | 1 | N,Z |
| | | RRNC Ws, Wd | $Wd = \text{Rotate Right (No Carry) } Ws$ | 1 | 1 | N,Z |
| 68 | SAC | SAC $Acc, \#Slit4, Wdc^{(1)}$ | Store Accumulator | 1 | 1 | None |
| | | SAC.R $Acc, \#Slit4, Wdc^{(1)}$ | Store Rounded Accumulator | 1 | 1 | None |
| 69 | SE | SE Ws, Wnd | $Wnd = \text{Sign-Extended } Ws$ | 1 | 1 | C,N,Z |
| 70 | SETM | SETM f | $f = 0xFFFF$ | 1 | 1 | None |
| | | SETM $WREG$ | $WREG = 0xFFFF$ | 1 | 1 | None |
| | | SETM Ws | $Ws = 0xFFFF$ | 1 | 1 | None |
| 71 | SFTAC | SFTAC $Acc, Wn^{(1)}$ | Arithmetic Shift Accumulator by (Wn) | 1 | 1 | OA,OB,OAB,SA,SB,SAB |
| | | SFTAC $Acc, \#Slit6^{(1)}$ | Arithmetic Shift Accumulator by $Slit6$ | 1 | 1 | OA,OB,OAB,SA,SB,SAB |

Note 1: These instructions are available in dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices only.

2: Read and Read-Modify-Write (e.g., bit operations and logical operations) on non-CPU SFRs incur an additional instruction cycle.

TABLE 28-2: INSTRUCTION SET OVERVIEW (CONTINUED)

| Base Instr # | Assembly Mnemonic | Assembly Syntax | Description | # of Words | # of Cycles ⁽²⁾ | Status Flags Affected |
|--------------|-------------------|---|--|------------|----------------------------|-----------------------|
| 72 | SL | SL <i>f</i> | <i>f</i> = Left Shift <i>f</i> | 1 | 1 | C,N,OV,Z |

| | | XOR <i>Wb</i> , #lit5, <i>Wd</i> | <i>Wd</i> = <i>Wb</i> .XOR. lit5 | 1 | 1 | N,Z |
| 84 | ZE | ZE <i>Ws</i> , <i>Wnd</i> | <i>Wnd</i> = Zero-Extend <i>Ws</i> | 1 | 1 | C,Z,N |

Note 1: These instructions are available in dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices only.

2: Read and Read-Modify-Write (e.g., bit operations and logical operations) on non-CPU SFRs incur an additional instruction cycle.

NOTES:

29.0 DEVELOPMENT SUPPORT

Move a design from concept to production in record time with Microchip's award-winning development tools. Microchip tools work together to provide state of the art debugging for any project with easy-to-use Graphical User Interfaces (GUIs) in our free MPLAB® X and Atmel Studio Integrated Development Environments (IDEs), and our code generation tools. Providing the ultimate ease-of-use experience, Microchip's line of programmers, debuggers and emulators work seamlessly with our software tools. Microchip development boards help evaluate the best silicon device for an application, while our line of third party tools round out our comprehensive development tool solutions.

Microchip's MPLAB X and Atmel Studio ecosystems provide a variety of embedded design tools to consider, which support multiple devices, such as PIC® MCUs, AVR® MCUs, SAM MCUs and dsPIC® DSCs. MPLAB X tools are compatible with Windows®, Linux® and Mac® operating systems while Atmel Studio tools are compatible with Windows.

Go to the following website for more information and details:

NOTES:

30.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings⁽¹⁾

| | |
|---|-----------------------|
| Ambient temperature under bias | -40°C to +125°C |
| Storage temperature | -65°C to +150°C |
| Voltage on VDD with respect to VSS | -0.3V to +4.0V |
| Voltage on any pin that is not 5V tolerant, with respect to VSS ⁽³⁾ | -0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 3.0V ⁽³⁾ | -0.3V to +5.5V |
| Voltage on any 5V tolerant pin with respect to VSS when VDD < 3.0V ⁽³⁾ | -0.3V to +3.6V |
| Maximum current out of VSS pin | 300 mA |
| Maximum current into VDD pin ⁽²⁾ | 300 mA |
| Maximum current sunk/sourced by any 4x I/O pin | 15 mA |
| Maximum current sunk/sourced by any 8x I/O pin | 25 mA |
| Maximum current sunk by all ports ^(2,4) | 200 mA |

Note 1: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see [Table 30-2](#)).

3: See the “[Pin Diagrams](#)” section for the 5V tolerant pins.

4: Exceptions are: dsPIC33EPXXXGP502, dsPIC33EPXXXMC202/502 and PIC24EPXXXGP/MC202 devices, which have a maximum sink/source capability of 130 mA.

30.1 DC Characteristics

TABLE 30-1: OPERATING MIPS VS. VOLTAGE

| Characteristic | VDD Range (in Volts) | Temp Range (in °C) | Maximum MIPS |
|----------------|-----------------------------|-----------------------|---|
| | | | dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X |
| — | 3.0V to 3.6V ⁽¹⁾ | -40°C to +85°C | 70 |
| — | 3.0V to 3.6V ⁽¹⁾ | -40°C to +125°C | 60 |

Note 1: Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules (ADC, op amp/comparator and comparator voltage reference) may have degraded performance. Device functionality is tested but not characterized. Refer to Parameter **BO10** in [Table 30-13](#) for the minimum and maximum BOR values.

TABLE 30-2: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min. | Typ. | Max. | Unit |
|--|--------|---------------------------|------|------|------|
| Industrial Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +125 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +85 | °C |
| Extended Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +140 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +125 | °C |
| Power Dissipation: Internal chip power dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \sum I_{OH})$ I/O Pin Power Dissipation: $I/O = \sum (\{V_{DD} - V_{OH}\} \times I_{OH}) + \sum (V_{OL} \times I_{OL})$ | PD | PINT + PI/O | | | W |
| Maximum Allowed Power Dissipation | PDMAX | $(T_J - T_A)/\theta_{JA}$ | | | W |

TABLE 30-3: THERMAL PACKAGING CHARACTERISTICS

| Characteristic | Symbol | Typ. | Max. | Unit | Notes |
|--|---------------|------|------|------|-------------------|
| Package Thermal Resistance, 64-Pin QFN | θ_{JA} | 28.0 | — | °C/W | 1 |
| Package Thermal Resistance, 64-Pin TQFP 10x10 mm | θ_{JA} | 48.3 | — | °C/W | 1 |
| Package Thermal Resistance, 48-Pin UQFN 6x6 mm | θ_{JA} | 41 | — | °C/W | 1 |
| Package Thermal Resistance, 44-Pin QFN | θ_{JA} | 29.0 | — | °C/W | 1 |
| Package Thermal Resistance, 44-Pin TQFP 10x10 mm | θ_{JA} | 49.8 | — | °C/W | 1 |
| Package Thermal Resistance, 44-Pin VTLA 6x6 mm | θ_{JA} | 25.2 | — | °C/W | 1 |
| Package Thermal Resistance, 36-Pin VTLA 5x5 mm | θ_{JA} | 28.5 | — | °C/W | 1 |
| Package Thermal Resistance, 36-Pin UQFN 5x5 mm | θ_{JA} | 29.2 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin QFN-S | θ_{JA} | 30.0 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SSOP | θ_{JA} | 71.0 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SOIC | θ_{JA} | 69.7 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SPDIP | θ_{JA} | 60.0 | — | °C/W | 1 |

Note 1: Junction to ambient thermal resistance, Theta-JA (θ_{JA}) numbers are achieved by package simulations.

TABLE 30-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions (see Note 1): 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------------|--------|---|--|------|------|-------|-----------------|
| Param No. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |
| Operating Voltage | | | | | | | |
| DC10 | VDD | Supply Voltage | 3.0 | — | 3.6 | V | |
| DC16 | VPOR | VDD Start Voltage to Ensure Internal Power-on Reset Signal | — | — | VSS | V | |
| DC17 | SVDD | VDD Rise Rate to Ensure Internal Power-on Reset Signal | 0.03 | — | — | V/ms | 0V-1V in 100 ms |

Note 1: Device is functional at VBORMIN < VDD < VDDMIN. Analog modules (ADC, op amp/comparator and comparator voltage reference) may have degraded performance. Device functionality is tested but not characterized. Refer to Parameter **BO10** in [Table 30-13](#) for the minimum and maximum BOR values.

TABLE 30-5: FILTER CAPACITOR (CEFC) SPECIFICATIONS

| Standard Operating Conditions (unless otherwise stated): Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | | | |
|---|--------|---|------|------|------|-------|--|
| Param No. | Symbol | Characteristics | Min. | Typ. | Max. | Units | Comments |
| | CEFC | External Filter Capacitor Value ⁽¹⁾ | 4.7 | 10 | — | μF | Capacitor must have a low series resistance (< 1 Ohm) |

Note 1: Typical VCAP voltage = 1.8 volts when VDD ≥ VDDMIN.

TABLE 30-6: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | |
|--|------|------|--|------------|------|---------|
| Parameter No. | Typ. | Max. | Units | Conditions | | |
| Operating Current (IDD) ⁽¹⁾ | | | | | | |
| DC20d | 9 | 15 | mA | -40°C | 3.3V | 10 MIPS |
| DC20a | 9 | 15 | mA | +25°C | | |
| DC20b | 9 | 15 | mA | +85°C | | |
| DC20c | 9 | 15 | mA | +125°C | | |
| DC22d | 16 | 25 | mA | -40°C | 3.3V | 20 MIPS |
| DC22a | 16 | 25 | mA | +25°C | | |
| DC22b | 16 | 25 | mA | +85°C | | |
| DC22c | 16 | 25 | mA | +125°C | | |
| DC24d | 27 | 40 | mA | -40°C | 3.3V | 40 MIPS |
| DC24a | 27 | 40 | mA | +25°C | | |
| DC24b | 27 | 40 | mA | +85°C | | |
| DC24c | 27 | 40 | mA | +125°C | | |
| DC25d | 36 | 55 | mA | -40°C | 3.3V | 60 MIPS |
| DC25a | 36 | 55 | mA | +25°C | | |
| DC25b | 36 | 55 | mA | +85°C | | |
| DC25c | 36 | 55 | mA | +125°C | | |
| DC26d | 41 | 60 | mA | -40°C | 3.3V | 70 MIPS |
| DC26a | 41 | 60 | mA | +25°C | | |
| DC26b | 41 | 60 | mA | +85°C | | |

Note 1: IDD is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows:

- Oscillator is configured in EC mode with PLL, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins (except OSC1) are configured as outputs and driven low
- $\overline{\text{MCLR}} = \text{VDD}$, WDT and FSCM are disabled
- CPU, SRAM, program memory and data memory are operational
- No peripheral modules are operating or being clocked (defined PMDx bits are all '1's)
- NOP instructions are executed in `while(1)` loop
- JTAG is disabled

TABLE 30-7: DC CHARACTERISTICS: IDLE CURRENT (IDLE)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | |
|------------------------------------|------|------|--|------------|------|---------|
| Parameter No. | Typ. | Max. | Units | Conditions | | |
| Idle Current (IDLE) ⁽¹⁾ | | | | | | |
| DC40d | 3 | 8 | mA | -40°C | 3.3V | 10 MIPS |
| DC40a | 3 | 8 | mA | +25°C | | |
| DC40b | 3 | 8 | mA | +85°C | | |
| DC40c | 3 | 8 | mA | +125°C | | |
| DC42d | 6 | 12 | mA | -40°C | 3.3V | 20 MIPS |
| DC42a | 6 | 12 | mA | +25°C | | |
| DC42b | 6 | 12 | mA | +85°C | | |
| DC42c | 6 | 12 | mA | +125°C | | |
| DC44d | 11 | 18 | mA | -40°C | 3.3V | 40 MIPS |
| DC44a | 11 | 18 | mA | +25°C | | |
| DC44b | 11 | 18 | mA | +85°C | | |
| DC44c | 11 | 18 | mA | +125°C | | |
| DC45d | 17 | 27 | mA | -40°C | 3.3V | 60 MIPS |
| DC45a | 17 | 27 | mA | +25°C | | |
| DC45b | 17 | 27 | mA | +85°C | | |
| DC45c | 17 | 27 | mA | +125°C | | |
| DC46d | 20 | 35 | mA | -40°C | 3.3V | 70 MIPS |
| DC46a | 20 | 35 | mA | +25°C | | |
| DC46b | 20 | 35 | mA | +85°C | | |

Note 1: Base Idle current (IDLE) is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock is active; OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{\text{MCLR}} = \text{VDD}$, WDT and FSCM are disabled
- No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are zeroed)
- The NVMSIDL bit (NVMCON[12]) = 1 (i.e., Flash regulator is set to standby while the device is in Idle mode)
- The VREGSF bit (RCON[11]) = 0 (i.e., Flash regulator is set to standby while the device is in Sleep mode)
- JTAG is disabled

TABLE 30-8: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | |
|---|------|------|---|------------|
| Parameter No. | Typ. | Max. | Units | Conditions |
| Power-Down Current (IPD)⁽¹⁾ – dsPIC33EP32GP50X, dsPIC33EP32MC20X/50X and PIC24EP32GP/MC20X | | | | |
| DC60d | 30 | 100 | μA | -40°C |
| DC60a | 35 | 100 | μA | +25°C |
| DC60b | 150 | 200 | μA | +85°C |
| DC60c | 250 | 500 | μA | +125°C |
| Power-Down Current (IPD)⁽¹⁾ – dsPIC33EP64GP50X, dsPIC33EP64MC20X/50X and PIC24EP64GP/MC20X | | | | |
| DC60d | 25 | 100 | μA | -40°C |
| DC60a | 30 | 100 | μA | +25°C |
| DC60b | 150 | 350 | μA | +85°C |
| DC60c | 350 | 800 | μA | +125°C |
| Power-Down Current (IPD)⁽¹⁾ – dsPIC33EP128GP50X, dsPIC33EP128MC20X/50X and PIC24EP128GP/MC20X | | | | |
| DC60d | 30 | 100 | μA | -40°C |
| DC60a | 35 | 100 | μA | +25°C |
| DC60b | 150 | 350 | μA | +85°C |
| DC60c | 550 | 1000 | μA | +125°C |
| Power-Down Current (IPD)⁽¹⁾ – dsPIC33EP256GP50X, dsPIC33EP256MC20X/50X and PIC24EP256GP/MC20X | | | | |
| DC60d | 35 | 100 | μA | -40°C |
| DC60a | 40 | 100 | μA | +25°C |
| DC60b | 250 | 450 | μA | +85°C |
| DC60c | 1000 | 1200 | μA | +125°C |
| Power-Down Current (IPD)⁽¹⁾ – dsPIC33EP512GP50X, dsPIC33EP512MC20X/50X and PIC24EP512GP/MC20X | | | | |
| DC60d | 40 | 100 | μA | -40°C |
| DC60a | 45 | 100 | μA | +25°C |
| DC60b | 350 | 800 | μA | +85°C |
| DC60c | 1100 | 1500 | μA | +125°C |

Note 1: IPD (Sleep) current is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock is active; OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to VDD
- MCLR = VDD, WDT and FSCM are disabled
- All peripheral modules are disabled (PMDx bits are all set)
- The VREGS bit (RCON[8]) = 0 (i.e., core regulator is set to standby while the device is in Sleep mode)
- The VREGSF bit (RCON[11]) = 0 (i.e., Flash regulator is set to standby while the device is in Sleep mode)
- JTAG is disabled

TABLE 30-9: DC CHARACTERISTICS: WATCHDOG TIMER DELTA CURRENT (ΔI_{WDT})⁽¹⁾

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | |
|--------------------|------|------|---|------------|------|
| Parameter No. | Typ. | Max. | Units | Conditions | |
| DC61d | 8 | — | μA | -40°C | 3.3V |
| DC61a | 10 | — | μA | +25°C | |
| DC61b | 12 | — | μA | +85°C | |
| DC61c | 13 | — | μA | +125°C | |

Note 1: The ΔI_{WDT} current is the additional current consumed when the module is enabled. This current should be added to the base IPD current. All parameters are characterized but not tested during manufacturing.

TABLE 30-10: DC CHARACTERISTICS: DOZE CURRENT (IDOZE)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | |
|---|------|------|---|-------|----------------------------------|
| Parameter No. | Typ. | Max. | Doze Ratio | Units | Conditions |
| Doze Current (IDOZE)⁽¹⁾ | | | | | |
| DC73a ⁽²⁾ | 35 | — | 1:2 | mA | -40°C 3.3V Fosc = 140 MHz |
| DC73g | 20 | 30 | 1:128 | mA | |
| DC70a ⁽²⁾ | 35 | — | 1:2 | mA | +25°C 3.3V Fosc = 140 MHz |
| DC70g | 20 | 30 | 1:128 | mA | |
| DC71a ⁽²⁾ | 35 | — | 1:2 | mA | +85°C 3.3V Fosc = 140 MHz |
| DC71g | 20 | 30 | 1:128 | mA | |
| DC72a ⁽²⁾ | 28 | — | 1:2 | mA | +125°C 3.3V Fosc = 120 MHz |
| DC72g | 15 | 30 | 1:128 | mA | |

Note 1: IDOZE is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDOZE measurements are as follows:

- Oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to Vss
- \overline{MCLR} = VDD, WDT and FSCM are disabled
- CPU, SRAM, program memory and data memory are operational
- No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are zeroed)
- CPU is executing `while(1)` statement
- JTAG is disabled

2: Parameter is characterized but not tested in manufacturing.

TABLE 30-11: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |
|----------------------|-----------------|--|---|------|---------------------|-------|--|
| Param No. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |
| DI10 DI18 DI19 | V _{IL} | Input Low Voltage | | | | | |
| | | Any I/O Pin and $\overline{\text{MCLR}}$ | V _{SS} | — | 0.2 V _{DD} | V | |
| | | I/O Pins with SDAx, SCLx | V _{SS} | — | 0.3 V _{DD} | V | SMBus disabled |
| | | I/O Pins with SDAx, SCLx | V _{SS} | — | 0.8 | V | SMBus enabled |
| DI20 | V _{IH} | Input High Voltage | | | | | |
| | | I/O Pins Not 5V Tolerant | 0.8 V _{DD} | — | V _{DD} | V | Note 3 |
| | | I/O Pins 5V Tolerant and $\overline{\text{MCLR}}$ | 0.8 V _{DD} | — | 5.5 | V | Note 3 |
| | | I/O Pins with SDAx, SCLx | 0.8 V _{DD} | — | 5.5 | V | SMBus disabled |
| | | I/O Pins with SDAx, SCLx | 2.1 | — | 5.5 | V | SMBus enabled |
| DI30 | ICNPU | Change Notification Pull-up Current | 150 | 250 | 550 | μA | V _{DD} = 3.3V, V _{PIN} = V _{SS} |
| DI31 | ICNPD | Change Notification Pull-Down Current⁽⁴⁾ | 20 | 50 | 100 | μA | V _{DD} = 3.3V, V _{PIN} = V _{DD} |

Note 1: The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.

2: Negative current is defined as current sourced by the pin.

3: See the “[Pin Diagrams](#)” section for the 5V tolerant pins.

4: V_{IL} source < (V_{SS} – 0.3). Characterized but not tested.

5: V_{IH} source > (V_{DD} + 0.3) for non-5V tolerant pins only.

6: Digital 5V tolerant pins do not have an internal high-side diode to V_{DD}, and therefore, cannot tolerate any “positive” input injection current.

7: Non-zero injection currents can affect the ADC results by approximately 4-6 counts.

8: Any number and/or combination of I/O pins not excluded under I_{ICL} or I_{ICH} conditions are permitted provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

TABLE 30-11: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS (CONTINUED)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |
|--------------------|-----------------|--|---|------|------|-------|--|
| Param No. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |
| DI50 | I _{IL} | Input Leakage Current ^(1,2) I/O Pins 5V Tolerant ⁽³⁾ | -1 | — | +1 | μA | V _{SS} ≤ V _{PIN} ≤ V _{DD} , Pin at high-impedance |
| DI51 | | I/O Pins Not 5V Tolerant ⁽³⁾ | -1 | — | +1 | μA | V _{SS} ≤ V _{PIN} ≤ V _{DD} , Pin at high-impedance, $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ |
| DI51a | | I/O Pins Not 5V Tolerant ⁽³⁾ | -1 | — | +1 | μA | Analog pins shared with external reference pins, $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ |
| DI51b | | I/O Pins Not 5V Tolerant ⁽³⁾ | -1 | — | +1 | μA | V _{SS} ≤ V _{PIN} ≤ V _{DD} , Pin at high-impedance, $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ |
| DI51c | | I/O Pins Not 5V Tolerant ⁽³⁾ | -1 | — | +1 | μA | Analog pins shared with external reference pins, $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ |
| DI55 | | MCLR | -5 | — | +5 | μA | V _{SS} ≤ V _{PIN} ≤ V _{DD} |
| DI56 | | OSC1 | -5 | — | +5 | μA | V _{SS} ≤ V _{PIN} ≤ V _{DD} , XT and HS modes |

- Note 1:** The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.
- 2:** Negative current is defined as current sourced by the pin.
- 3:** See the “[Pin Diagrams](#)” section for the 5V tolerant pins.
- 4:** V_{IL} source < (V_{SS} – 0.3). Characterized but not tested.
- 5:** V_{IH} source > (V_{DD} + 0.3) for non-5V tolerant pins only.
- 6:** Digital 5V tolerant pins do not have an internal high-side diode to V_{DD}, and therefore, cannot tolerate any “positive” input injection current.
- 7:** Non-zero injection currents can affect the ADC results by approximately 4-6 counts.
- 8:** Any number and/or combination of I/O pins not excluded under I_{ICL} or I_{ICH} conditions are permitted provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

TABLE 30-11: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS (CONTINUED)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |
|--------------------|------------------|--|---|------|-----------------------|-------|--|
| Param No. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |
| DI60a | I _{ICL} | Input Low Injection Current | 0 | — | -5 ^(4,7) | mA | All pins except V _{DD} , V _{SS} , AV _{DD} , AV _{SS} , MCLR, V _{CAP} and RB7 |
| DI60b | I _{ICH} | Input High Injection Current | 0 | — | +5 ^(5,6,7) | mA | All pins except V _{DD} , V _{SS} , AV _{DD} , AV _{SS} , MCLR, V _{CAP} , RB7 and all 5V tolerant pins ⁽⁶⁾ |
| DI60c | ΣI_{ICT} | Total Input Injection Current (sum of all I/O and control pins) | -20 ⁽⁸⁾ | — | +20 ⁽⁸⁾ | mA | Absolute instantaneous sum of all \pm input injection currents from all I/O pins ($ I_{ICL} + I_{ICH} $) $\leq \Sigma I_{ICT}$ |

- Note 1:** The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.
- 2:** Negative current is defined as current sourced by the pin.
- 3:** See the “[Pin Diagrams](#)” section for the 5V tolerant pins.
- 4:** V_{IL} source < (V_{SS} – 0.3). Characterized but not tested.
- 5:** V_{IH} source > (V_{DD} + 0.3) for non-5V tolerant pins only.
- 6:** Digital 5V tolerant pins do not have an internal high-side diode to V_{DD}, and therefore, cannot tolerate any “positive” input injection current.
- 7:** Non-zero injection currents can affect the ADC results by approximately 4-6 counts.
- 8:** Any number and/or combination of I/O pins not excluded under I_{ICL} or I_{ICH} conditions are permitted provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

TABLE 30-12: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|--|---|------|------|-------|--|
| Param. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |
| DO10 | VOL | Output Low Voltage 4x Sink Driver Pins ⁽²⁾ | — | — | 0.4 | V | VDD = 3.3V, IOL ≤ 6 mA, -40°C ≤ TA ≤ +85°C, IOL ≤ 5 mA, +85°C < TA ≤ +125°C |
| | | Output Low Voltage 8x Sink Driver Pins ⁽³⁾ | — | — | 0.4 | V | VDD = 3.3V, IOL ≤ 12 mA, -40°C ≤ TA ≤ +85°C, IOL ≤ 8 mA, +85°C < TA ≤ +125°C |
| DO20 | VOH | Output High Voltage 4x Source Driver Pins ⁽²⁾ | 2.4 | — | — | V | IOH ≥ -10 mA, VDD = 3.3V |
| | | Output High Voltage 8x Source Driver Pins ⁽³⁾ | 2.4 | — | — | V | IOH ≥ -15 mA, VDD = 3.3V |
| DO20A | VOH1 | Output High Voltage 4x Source Driver Pins ⁽²⁾ | 1.5 ⁽¹⁾ | — | — | V | IOH ≥ -14 mA, VDD = 3.3V |
| | | | 2.0 ⁽¹⁾ | — | — | | IOH ≥ -12 mA, VDD = 3.3V |
| | | | 3.0 ⁽¹⁾ | — | — | | IOH ≥ -7 mA, VDD = 3.3V |
| | | Output High Voltage 8x Source Driver Pins ⁽³⁾ | 1.5 ⁽¹⁾ | — | — | V | IOH ≥ -22 mA, VDD = 3.3V |
| | | | 2.0 ⁽¹⁾ | — | — | | IOH ≥ -18 mA, VDD = 3.3V |
| | | | 3.0 ⁽¹⁾ | — | — | | IOH ≥ -10 mA, VDD = 3.3V |

Note 1: Parameters are characterized but not tested.

2: Includes all I/O pins that are not 8x Sink Driver pins (see below).

3: Includes the following pins:

For devices with less than 64 pins: RA3, RA4, RA9, RB[7:15] and RC3

For 64-pin devices: RA4, RA9, RB[7:15], RC3 and RC15

TABLE 30-13: ELECTRICAL CHARACTERISTICS: BOR

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) ⁽¹⁾ Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|--|--|------|------|-------|---------------------|
| Param No. | Symbol | Characteristic | Min. ⁽²⁾ | Typ. | Max. | Units | Conditions |
| BO10 | VBOR | BOR Event on VDD Transition High-to-Low | 2.65 | — | 2.95 | V | VDD (Notes 2 and 3) |

Note 1: Device is functional at VBORMIN < VDD < VDDMIN, but will have degraded performance. Device functionality is tested, but not characterized. Analog modules (ADC, op amp/comparator and comparator voltage reference) may have degraded performance.

2: Parameters are for design guidance only and are not tested in manufacturing.

3: The VBOR specification is relative to VDD.

TABLE 30-14: DC CHARACTERISTICS: PROGRAM MEMORY

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|-----------------------------|--------|--|---|---------------------|------|------------|--|
| Param No. | Symbol | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| Program Flash Memory | | | | | | | |
| D130 | EP | Cell Endurance | 10,000 | — | — | E/W | -40°C to +125°C |
| D131 | VPR | VDD for Read | 3.0 | — | 3.6 | V | |
| D132b | VPEW | VDD for Self-Timed Write | 3.0 | — | 3.6 | V | |
| D134 | TRETD | Characteristic Retention | 20 | — | — | Year | Provided no other specifications are violated, -40°C to +125°C |
| D135 | IDDP | Supply Current during Programming ⁽²⁾ | — | 10 | — | mA | |
| D136 | IPEAK | Instantaneous Peak Current During Start-up | — | — | 150 | mA | |
| D137a | TPE | Page Erase Time | — | 146,893 | — | FRC cycles | TA = +85°C |
| D137b | TPE | Page Erase Time | — | 146,893 | — | FRC cycles | TA = +125°C |
| D138a | TWW | Word Write Cycle Time | — | 346 | — | FRC cycles | TA = +85°C |
| D138b | TWW | Word Write Cycle Time | — | 346 | — | FRC cycles | TA = +125°C |

Note 1: Data in “Typical” column are at 3.3V, +25°C unless otherwise stated.

2: Parameter characterized but not tested in manufacturing.

30.2 AC Characteristics and Timing Parameters

This section defines dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X AC characteristics and timing parameters.

TABLE 30-15: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

| | |
|---------------------------|---|
| AC CHARACTERISTICS | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended Operating voltage V_{DD} range as described in Section 30.1 “DC Characteristics” . |
|---------------------------|---|

FIGURE 30-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

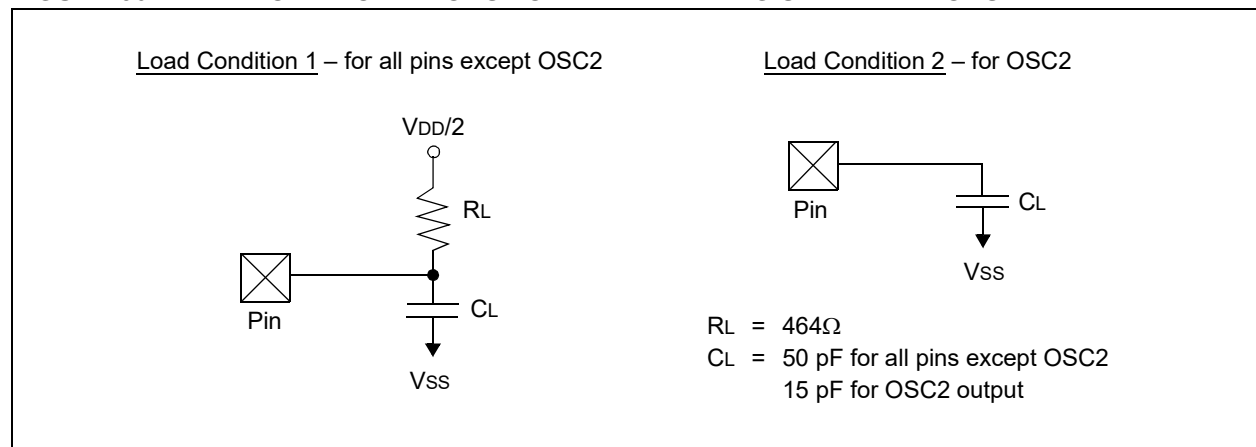

TABLE 30-16: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

| Param No. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |
|-----------|--------|-----------------------|------|------|------|-------|---|
| DO50 | Cosco | OSC2 Pin | — | — | 15 | pF | In XT and HS modes, when external clock is used to drive OSC1 |
| DO56 | Cio | All I/O Pins and OSC2 | — | — | 50 | pF | EC mode |
| DO58 | Cb | SCLx, SDAx | — | — | 400 | pF | In I ² C mode |

FIGURE 30-2: EXTERNAL CLOCK TIMING

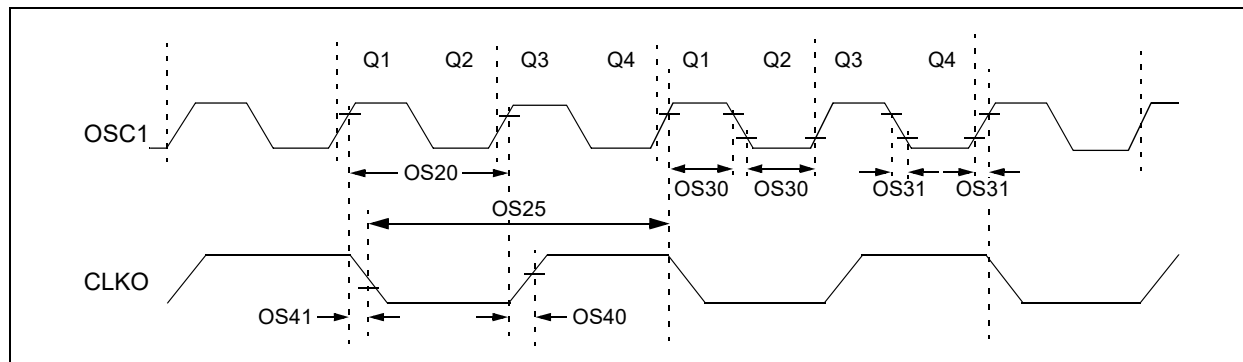

TABLE 30-17: EXTERNAL CLOCK TIMING REQUIREMENTS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|---------------|---|---|---------------------|-------------|------------|-------------------------------|
| Param No. | Symb | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| OS10 | FIN | External CLKI Frequency (External clocks allowed only in EC and ECPLL modes) | DC | — | 60 | MHz | EC |
| | | Oscillator Crystal Frequency | 3.5 10 | — — | 10 25 | MHz MHz | XT HS |
| OS20 | Tosc | Tosc = 1/Fosc | 8.33 | — | DC | ns | +125°C |
| | | Tosc = 1/Fosc | 7.14 | — | DC | ns | +85°C |
| OS25 | Tcy | Instruction Cycle Time ⁽²⁾ | 16.67 | — | DC | ns | +125°C |
| | | Instruction Cycle Time ⁽²⁾ | 14.28 | — | DC | ns | +85°C |
| OS30 | TosL, TosH | External Clock in (OSC1) High or Low Time | 0.45 x Tosc | — | 0.55 x Tosc | ns | EC |
| OS31 | TosR, TosF | External Clock in (OSC1) Rise or Fall Time | — | — | 20 | ns | EC |
| OS40 | TckR | CLKO Rise Time ^(3,4) | — | 5.2 | — | ns | |
| OS41 | TckF | CLKO Fall Time ^(3,4) | — | 5.2 | — | ns | |
| OS42 | GM | External Oscillator Transconductance ⁽⁴⁾ | — | 12 | — | mA/V | HS, VDD = 3.3V, TA = +25°C |
| | | | — | 6 | — | mA/V | XT, VDD = 3.3V, TA = +25°C |

Note 1: Data in "Typical" column are at 3.3V, +25°C unless otherwise stated.

2: Instruction cycle period (Tcy) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "Minimum" values with an external clock applied to the OSC1 pin. When an external clock input is used, the "Maximum" cycle time limit is "DC" (no clock) for all devices.

3: Measurements are taken in EC mode. The CLKO signal is measured on the OSC2 pin.

4: This parameter is characterized, but not tested in manufacturing.

TABLE 30-18: PLL CLOCK TIMING SPECIFICATIONS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|---|--|---------------------|------|-------|--------------------|
| Param No. | Symbol | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| OS50 | FPLLI | PLL Voltage Controlled Oscillator (VCO) Input Frequency Range | 0.8 | — | 8.0 | MHz | ECPLL, XTPLL modes |
| OS51 | FVCO | On-Chip VCO System Frequency | 120 | — | 340 | MHz | |
| OS52 | TLOCK | PLL Start-up Time (Lock Time) | 0.9 | 1.5 | 3.1 | ms | |
| OS53 | DCLK | CLKO Stability (Jitter) ⁽²⁾ | -3 | 0.5 | 3 | % | |

Note 1: Data in "Typical" column are at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: This jitter specification is based on clock cycle-by-clock cycle measurements. To get the effective jitter for individual time bases, or communication clocks used by the application, use the following formula:

$$\text{Effective Jitter} = \frac{DCLK}{\sqrt{\frac{FOSC}{\text{Time Base or Communication Clock}}}}$$

For example, if Fosc = 120 MHz and the SPIx bit rate = 10 MHz, the effective jitter is as follows:

$$\text{Effective Jitter} = \frac{DCLK}{\sqrt{\frac{120}{10}}} = \frac{DCLK}{\sqrt{12}} = \frac{DCLK}{3.464}$$

TABLE 30-19: INTERNAL FRC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | |
|---|----------------|---|------|------|-------|---------------------|----------------|
| Param No. | Characteristic | Min. | Typ. | Max. | Units | Conditions | |
| Internal FRC Accuracy @ FRC Frequency = 7.37 MHz ⁽¹⁾ | | | | | | | |
| F20a | FRC | -1.5 | 0.5 | +1.5 | % | -40°C ≤ TA ≤ -10°C | VDD = 3.0-3.6V |
| | | -1 | 0.5 | +1 | % | -10°C ≤ TA ≤ +85°C | VDD = 3.0-3.6V |
| F20b | FRC | -2 | 1 | +2 | % | +85°C ≤ TA ≤ +125°C | VDD = 3.0-3.6V |

Note 1: Frequency is calibrated at +25°C and 3.3V. TUNx bits can be used to compensate for temperature drift.

TABLE 30-20: INTERNAL LPRC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | |
|----------------------------------|----------------|--|------|------|-------|---------------------|----------------|
| Param No. | Characteristic | Min. | Typ. | Max. | Units | Conditions | |
| LPRC @ 32.768 kHz ⁽¹⁾ | | | | | | | |
| F21a | LPRC | -30 | — | +30 | % | -40°C ≤ TA ≤ -10°C | VDD = 3.0-3.6V |
| | | -20 | — | +20 | % | -10°C ≤ TA ≤ +85°C | VDD = 3.0-3.6V |
| F21b | LPRC | -30 | — | +30 | % | +85°C ≤ TA ≤ +125°C | VDD = 3.0-3.6V |

Note 1: The change of LPRC frequency as VDD changes.

FIGURE 30-3: I/O TIMING CHARACTERISTICS

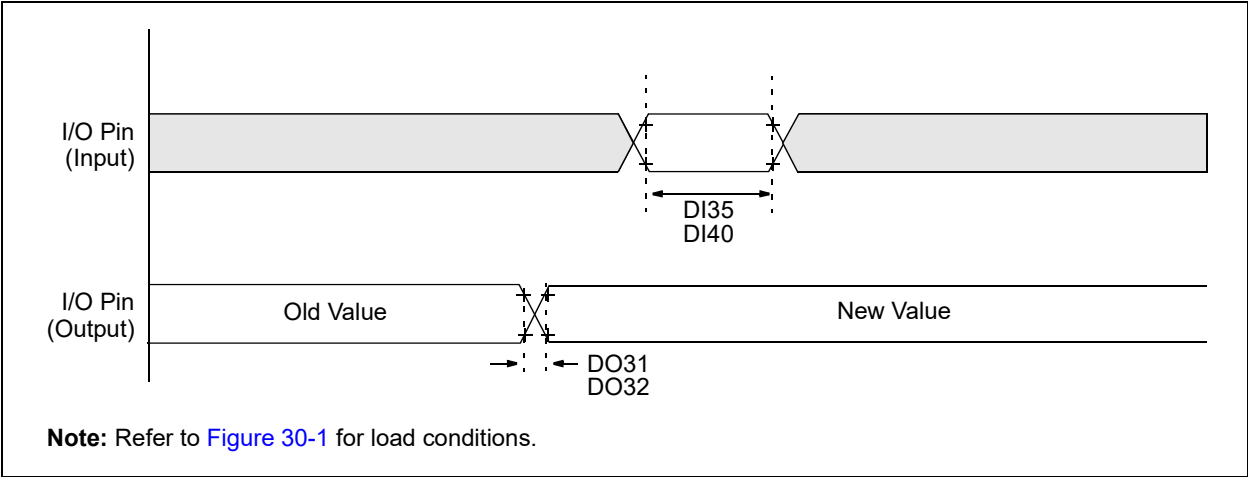

TABLE 30-21: I/O TIMING REQUIREMENTS

| AC CHARACTERISTICS | | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | |
|--------------------|--------|-----------------------------------|------|---|------|-----------------|------------|

| SP31 | TdoR | SDO2 Data Output Rise Time | — | — | — | ns | See Parameter DO31 (Note 4) |
| SP35 | Tsch2doV, TscL2doV | SDO2 Data Output Valid after SCK2 Edge | — | 6 | 20 | ns | |
| SP36 | TdoV2scH, TdoV2scL | SDO2 Data Output Setup to First SCK2 Edge | 30 | — | — | ns | |
| SP40 | TdiV2scH, TdiV2scL | Setup Time of SDI2 Data Input to SCK2 Edge | 30 | — | — | ns | |
| SP41 | Tsch2diL, TscL2diL | Hold Time of SDI2 Data Input to SCK2 Edge | 30 | — | — | ns | |
| SP50 | TssL2scH, TssL2scL | $\overline{SS2}$ ↓ to SCK2 ↑ or SCK2 ↓ Input | 120 | — | — | ns | |
| SP51 | TssH2doZ | $\overline{SS2}$ ↑ to SDO2 Output High-Impedance | 10 | — | 50 | ns | Note 4 |
| SP52 | Tsch2ssH, TscL2ssH | $\overline{SS2}$ ↑ after SCK2 Edge | 1.5 Tcy + 40 | — | — | ns | Note 4 |
| SP60 | TssL2doV | SDO2 Data Output Valid after $\overline{SS2}$ Edge | — | — | 50 | ns | |

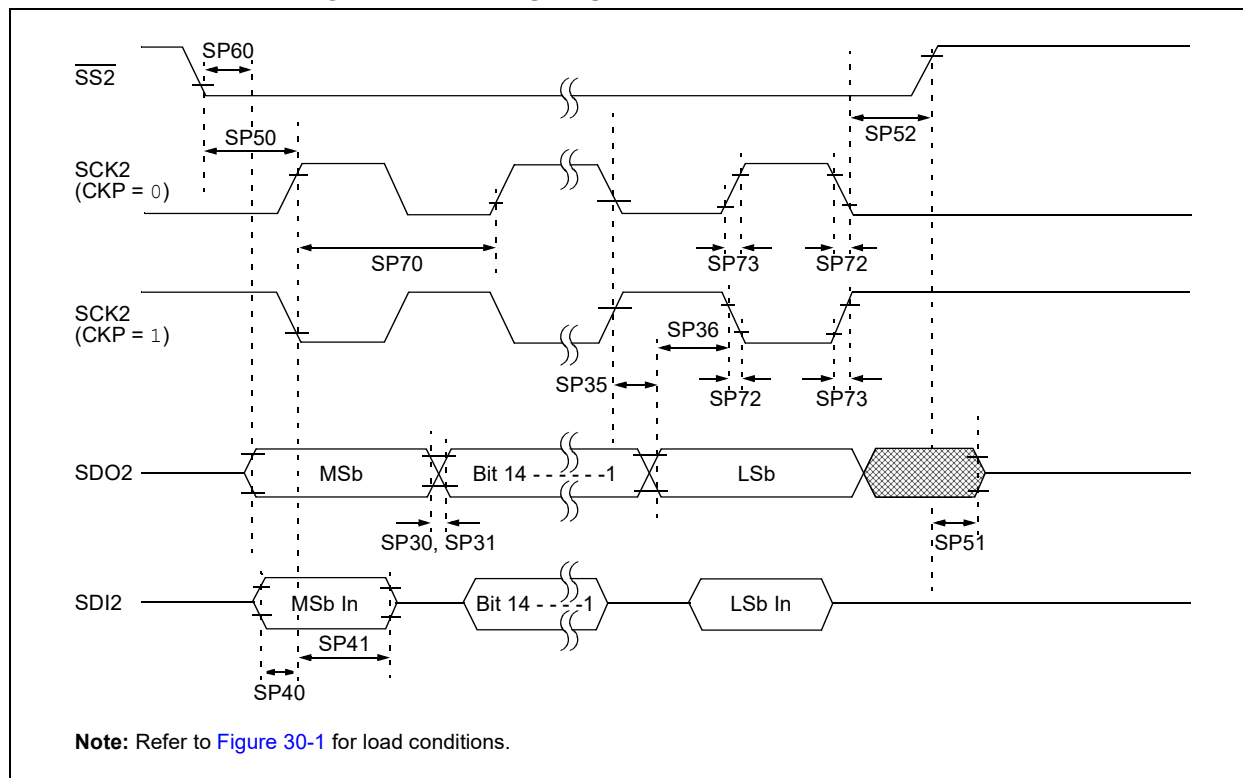

Note 1: These parameters are characterized, but are not tested in manufacturing.

2: Data in "Typical" column are at 3.3V, +25°C unless otherwise stated.

3: The minimum clock period for SCK2 is 66.7 ns. Therefore, the SCK2 clock generated by the master must not violate this specification.

4: Assumes 50 pF load on all SPI2 pins.

| SP72 | TscF | SCK1 Input Fall Time | — | — | — | ns | See Parameter DO32 (Note 4) |
| SP73 | TscR | SCK1 Input Rise Time | — | — | — | ns | See Parameter DO31 (Note 4) |
| SP30 | TdoF | SDO1 Data Output Fall Time | — | — | — | ns | See Parameter DO32 (Note 4) |
| SP31 | TdoR | SDO1 Data Output Rise Time | — | — | — | ns | See Parameter DO31 (Note 4) |
| SP35 | Tsch2doV, TscL2doV | SDO1 Data Output Valid after SCK1 Edge | — | 6 | 20 | ns | |
| SP36 | TdoV2scH, TdoV2scL | SDO1 Data Output Setup to First SCK1 Edge | 30 | — | — | ns | |
| SP40 | TdiV2scH, TdiV2scL | Setup Time of SDI1 Data Input to SCK1 Edge | 30 | — | — | ns | |
| SP41 | Tsch2diL, TscL2diL | Hold Time of SDI1 Data Input to SCK1 Edge | 30 | — | — | ns | |
| SP50 | TssL2scH, TssL2scL | $\overline{SS1} \downarrow$ to SCK1 \uparrow or SCK1 \downarrow Input | 120 | — | — | ns | |
| SP51 | TssH2doZ | $\overline{SS1} \uparrow$ to SDO1 Output High-Impedance | 10 | — | 50 | ns | Note 4 |
| SP52 | Tsch2ssH, TscL2ssH | $\overline{SS1} \uparrow$ after SCK1 Edge | 1.5 TCY + 40 | — | — | ns | Note 4 |

Note 1: These parameters are characterized, but are not tested in manufacturing.

2: Data in “Typical” column are at 3.3V, +25°C unless otherwise stated.

3: The minimum clock period for SCK1 is 91 ns. Therefore, the SCK1 clock generated by the master must not violate this specification.

4: Assumes 50 pF load on all SPI1 pins.

| CM23b | GBW | Gain Bandwidth (Configuration B) ^(3,5) | — | 6 | — | MHz | 10 pF load |

Note 1: Device is functional at VBORMIN < VDD < VDDMIN, but will have degraded performance. Device functionality is tested, but not characterized. Analog modules (ADC, op amp/comparator and comparator voltage reference) may have degraded performance. Refer to Parameter **BO10** in [Table 30-13](#) for the minimum and maximum BOR values.

2: Data in "Typ" column are at 3.3V, +25°C unless otherwise stated.

3: Parameter is characterized but not tested in manufacturing.

4: See [Figure 25-6](#) for configuration information.

5: See [Figure 25-7](#) for configuration information.

6: Resistances can vary by ±10% between op amps.

7: These parameters have a combined effect on the actual performance of the comparator.

8: Input resistance (R1) must be less than or equal to 2 kOhm. The resulting minimum gain of the op amp circuit is equal to four.

TABLE 30-53: OP AMP/COMPARATOR SPECIFICATIONS (CONTINUED)

| | | | — | -1.56 | — | mV/°C | CTMUICON[9:8] = 11 |

Note 1: Nominal value at center point of current trim range (CTMUICON[15:10] = 000000).

2: Parameters are characterized but not tested in manufacturing.

3: Measurements taken with the following conditions:

- $V_{REF+} = AV_{DD} = 3.3\text{V}$
- ADC configured for 10-bit mode
- ADC module configured for conversion speed of 500 ksp/s
- All PMDx bits are cleared (PMDx = 0)
- Executing a `while(1)` statement
- Device operating from the FRC with no PLL

Analog modules (ADC, op amp/comparator and comparator voltage reference) may have degraded performance. Refer to Parameter BO10 in Table 30-13 for the minimum and maximum BOR values.

2: Parameters are characterized but not tested in manufacturing.

3: Because the sample caps will eventually lose charge, clock rates below 10 kHz may affect linearity performance, especially at elevated temperatures.

4: See Figure 25-6 for configuration information.

5: See Figure 25-7 for configuration information.

6: The parameter, tDPU, is the time required for the ADC module to stabilize at the appropriate level when the module is turned on (ADON (AD1CON1[15]) = 1). During this time, the ADC result is indeterminate.

TABLE 30-62: DMA MODULE TIMING REQUIREMENTS

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------------------------------|---|---------------------|------|-------|------------|
| Param No. | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| DM1 | DMA Byte/Word Transfer Latency | 1 Tcy ⁽²⁾ | — | — | ns | |

Note 1: These parameters are characterized, but not tested in manufacturing.

2: Because DMA transfers use the CPU data bus, this time is dependent on other functions on the bus.

NOTES:

31.0 HIGH-TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X electrical characteristics for devices operating in an ambient temperature range of -40°C to +150°C.

The specifications between -40°C to +150°C are identical to those shown in [Section 30.0 “Electrical Characteristics”](#) for operation between -40°C to +125°C, with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, Parameter [DC10](#) in [Section 30.0 “Electrical Characteristics”](#) is the Industrial and Extended temperature equivalent of [HDC10](#).

Absolute maximum ratings for the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X high-temperature devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings⁽¹⁾

| | |
|---|-----------------------|
| Ambient temperature under bias ⁽²⁾ | -40°C to +150°C |
| Storage temperature | -65°C to +160°C |
| Voltage on VDD with respect to VSS | -0.3V to +4.0V |
| Voltage on any pin that is not 5V tolerant with respect to VSS ⁽³⁾ | -0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to VSS when VDD < 3.0V ⁽³⁾ | -0.3V to 3.6V |
| Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 3.0V ⁽³⁾ | -0.3V to 5.5V |
| Maximum current out of VSS pin | 60 mA |
| Maximum current into VDD pin ⁽⁴⁾ | 60 mA |
| Maximum junction temperature | +155°C |
| Maximum current sourced/sunk by any 4x I/O pin | 10 mA |
| Maximum current sourced/sunk by any 8x I/O pin | 15 mA |
| Maximum current sunk by all ports combined | 70 mA |
| Maximum current sourced by all ports combined ⁽⁴⁾ | 70 mA |

Note 1: Stresses above those listed under “Absolute Maximum Ratings” can cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods can affect device reliability.

2: AEC-Q100 reliability testing for devices intended to operate at +150°C is 1,000 hours. Any design in which the total operating time from +125°C to +150°C will be greater than 1,000 hours is not warranted without prior written approval from Microchip Technology Inc.

3: Refer to the “[Pin Diagrams](#)” section for 5V tolerant pins.

4: Maximum allowable current is a function of device maximum power dissipation (see [Table 31-2](#)).

31.1 High-Temperature DC Characteristics

TABLE 31-1: OPERATING MIPS VS. VOLTAGE

| Characteristic | VDD Range (in Volts) | Temperature Range (in °C) | Max MIPS |
|----------------|----------------------------|------------------------------|---|
| | | | dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X |
| HDC5 | 3.0 to 3.6V ⁽¹⁾ | -40°C to +150°C | 40 |

Note 1: Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules, such as the ADC, may have degraded performance. Device functionality is tested but not characterized.

TABLE 31-2: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min | Typ | Max | Unit |
|--|--------|---------------------------|-----|------|------|
| High-Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +165 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +150 | °C |
| Power Dissipation: Internal Chip Power Dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \sum I_{OH})$ I/O Pin Power Dissipation: $I/O = \sum (\{V_{DD} - V_{OH}\} \times I_{OH}) + \sum (V_{OL} \times I_{OL})$ | PD | PINT + PI/O | | | W |
| Maximum Allowed Power Dissipation | PDMAX | $(T_J - T_A)/\theta_{JA}$ | | | W |

TABLE 31-3: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^\circ\text{C} \leq T_A \leq +150^\circ\text{C}$ | | | | |
|--------------------------|-----------------------|----------------|--|-----|-----|-------|-----------------|
| Parameter No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |
| Operating Voltage | | | | | | | |
| HDC10 | Supply Voltage | | | | | | |
| | VDD | — | 3.0 | 3.3 | 3.6 | V | -40°C to +150°C |

TABLE 31-4: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +150°C | | | |
|--------------------------|---------|------|--|------------|------|--|
| Parameter No. | Typical | Max | Units | Conditions | | |
| Power-Down Current (IPD) | | | | | | |
| HDC60e | 1400 | 2500 | μA | +150°C | 3.3V | Base Power-Down Current (Notes 1 and 3) |
| HDC61c | 15 | — | μA | +150°C | 3.3V | Watchdog Timer Current: ΔIWDT (Notes 2 and 4) |

- Note 1:** Base IPD is measured with all peripherals and clocks shut down. All I/Os are configured as inputs and pulled to Vss. WDT, etc., are all switched off and VREGS (RCON[8]) = 1.
- Note 2:** The Δ current is the additional current consumed when the module is enabled. This current should be added to the base IPD current.
- Note 3:** These currents are measured on the device containing the most memory in this family.
- Note 4:** These parameters are characterized, but are not tested in manufacturing.

TABLE 31-5: DC CHARACTERISTICS: IDLE CURRENT (I_{IDLE})

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | |
|--------------------|---------|-----|--|------------|------|---------|
| Parameter No. | Typical | Max | Units | Conditions | | |
| HDC44e | 12 | 30 | mA | +150°C | 3.3V | 40 MIPS |

TABLE 31-6: DC CHARACTERISTICS: OPERATING CURRENT (I_{DD})

|--------------------|---------|-----|--|------------|------|---------|
| Parameter No. | Typical | Max | Units | Conditions | | |
| HDC20 | 9 | 15 | mA | +150°C | 3.3V | 10 MIPS |
| HDC22 | 16 | 25 | mA | +150°C | 3.3V | 20 MIPS |
| HDC23 | 30 | 50 | mA | +150°C | 3.3V | 40 MIPS |

TABLE 31-7: DC CHARACTERISTICS: DOZE CURRENT (I_{DOZE})

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | |
|-----------------------|---------|-----|--|-------|------------|------|
| Parameter No. | Typical | Max | Doze Ratio | Units | Conditions | |
| HDC72a | 24 | 35 | 1:2 | mA | +150°C | 3.3V |
| HDC72f ⁽¹⁾ | 14 | — | 1:64 | mA | | |
| HDC72g ⁽¹⁾ | 12 | — | 1:128 | mA | | |

- Note 1:** Parameters with Doze ratios of 1:64 and 1:128 are characterized, but are not tested in manufacturing.

TABLE 31-8: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | | |
|--------------------|--------|--|--|------|------|-------|---|
| Param. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |
| HDO10 | VOL | Output Low Voltage 4x Sink Driver Pins ⁽²⁾ | — | — | 0.4 | V | $I_{OL} \leq 5\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |
| | | Output Low Voltage 8x Sink Driver Pins ⁽³⁾ | — | — | 0.4 | V | $I_{OL} \leq 8\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |
| HDO20 | VOH | Output High Voltage 4x Source Driver Pins ⁽²⁾ | 2.4 | — | — | V | $I_{OH} \geq -10\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |
| | | Output High Voltage 8x Source Driver Pins ⁽³⁾ | 2.4 | — | — | V | $I_{OH} \geq 15\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |
| HDO20A | VOH1 | Output High Voltage 4x Source Driver Pins ⁽²⁾ | 1.5 | — | — | V | $I_{OH} \geq -3.9\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |
| | | | 2.0 | — | — | | $I_{OH} \geq -3.7\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |
| | | | 3.0 | — | — | | $I_{OH} \geq -2\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |
| | | Output High Voltage 8x Source Driver Pins ⁽³⁾ | 1.5 | — | — | V | $I_{OH} \geq -7.5\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |
| | | | 2.0 | — | — | | $I_{OH} \geq -6.8\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |
| | | | 3.0 | — | — | | $I_{OH} \geq -3\text{ mA}$, $V_{DD} = 3.3\text{V}$ (Note 1) |

Note 1: Parameters are characterized, but not tested.

2: Includes all I/O pins that are not 8x Sink Driver pins (see below).

3: Includes the following pins:

For devices with less than 64 pins: RA3, RA4, RA9, RB[15:7] and RC3

For 64-pin devices: RA4, RA9, RB[15:7], RC3 and RC15

TABLE 31-9: DC CHARACTERISTICS: PROGRAM MEMORY

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | |
|--------------------|--------|---|---|------|------|-------|--|
| Param. | Symbol | Characteristic ⁽¹⁾ | Min. | Typ. | Max. | Units | Conditions |
| HD130 | EP | Program Flash Memory Cell Endurance | 10,000 | — | — | E/W | -40°C to $+150^{\circ}\text{C}$ ⁽²⁾ |
| HD134 | TRETD | Characteristic Retention | 20 | — | — | Year | 1000 E/W cycles or less and no other specifications are violated |

Note 1: These parameters are assured by design, but are not characterized or tested in manufacturing.

2: Programming of the Flash memory is allowed up to $+150^{\circ}\text{C}$.

31.2 AC Characteristics and Timing Parameters

The information contained in this section defines dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X AC characteristics and timing parameters for high-temperature devices. However, all AC timing specifications in this section are the same as those in [Section 30.2 “AC Characteristics and Timing Parameters”](#), with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, Parameter [HOS53](#) in [Section 30.2 “AC Characteristics and Timing Parameters”](#) is the Industrial and Extended temperature equivalent of [HOS53](#).

TABLE 31-10: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

| | |
|---------------------------|--|
| AC CHARACTERISTICS | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ Operating voltage VDD range as described in Table 31-1 . |
|---------------------------|--|

FIGURE 31-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

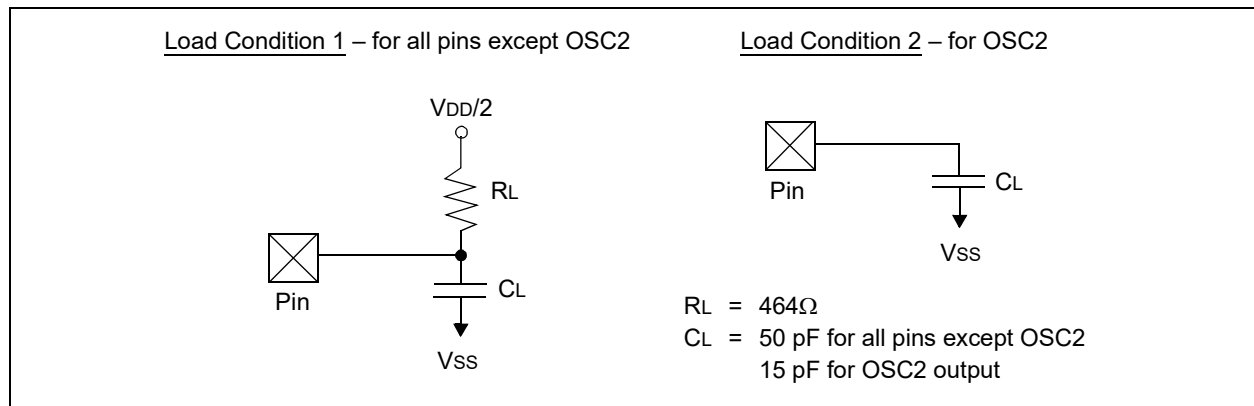

TABLE 31-11: PLL CLOCK TIMING SPECIFICATIONS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | | |
|---------------------------|--------|--|--|-----|-----|-------|-----------------------------|
| Param No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |
| HOS53 | DCLK | CLKO Stability (Jitter) ⁽¹⁾ | -5 | 0.5 | 5 | % | Measured over 100 ms period |

Note 1: These parameters are characterized by similarity, but are not tested in manufacturing. This specification is based on clock cycle by clock cycle measurements. To calculate the effective jitter for individual time bases or communication clocks use this formula:

$$\text{Peripheral Clock Jitter} = \frac{DCLK}{\sqrt{\left(\frac{FOSC}{\text{Peripheral Bit Rate Clock}}\right)}}$$

For example: FOSC = 32 MHz, DCLK = 5%, SPIx bit rate clock (i.e., SCKx) is 2 MHz.

$$\text{SPI SCK Jitter} = \left[\frac{DCLK}{\sqrt{\left(\frac{32 \text{ MHz}}{2 \text{ MHz}}\right)}} \right] = \left[\frac{5\%}{\sqrt{16}} \right] = \left[\frac{5\%}{4} \right] = 1.25\%$$

TABLE 31-12: INTERNAL FRC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature +125°C ≤ TA ≤ +150°C for High Temperature | | | | | |
|--------------------|---|---|-----|-----|-------|----------------------|----------------|
| Param No. | Characteristic | Min | Typ | Max | Units | Conditions | |
| H20 | Internal FRC Accuracy @ FRC Frequency = 7.37 MHz ⁽¹⁾ | | | | | | |
| | FRC | -3 | -2 | +3 | % | +125°C ≤ TA ≤ +150°C | VDD = 3.0-3.6V |

Note 1: Frequency is calibrated at $+25^{\circ}\text{C}$ and 3.3V.

TABLE 31-13: INTERNAL RC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +150°C | | | | | |
|--------------------|------------------------------------|---|-----|-----|-------|---------------------|----------------|
| Param No. | Characteristic | Min | Typ | Max | Units | Conditions | |
| HF21 | LPRC @ 32.768 kHz ^(1,2) | | | | | | |
| | LPRC | -30 | — | +30 | % | -40°C ≤ TA ≤ +150°C | VDD = 3.0-3.6V |

Note 1: Change of LPRC frequency as V_{DD} changes.

2: LPRC accuracy impacts the Watchdog Timer Time-out Period (TWDT). See [Section 27.5 “Watchdog Timer \(WDT\)”](#) for more information.

TABLE 31-14: OP AMP/COMPARATOR SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | | |
|---------------------------|---------|-----------------------|--|---------|------|-------|------------|
| Param No. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |
| Op Amp DC Characteristics | | | | | | | |
| HCM42 | VOFFSET | Op Amp Offset Voltage | -40 | ± 5 | +40 | mV | |

TABLE 31-15: ADC MODULE SPECIFICATIONS (12-BIT MODE)

| AC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | | |
|--|--------|---------------------------|--|-----|-----|-------|--|
| Param No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |
| ADC Accuracy (12-Bit Mode) ⁽¹⁾ | | | | | | | |
| HAD20a | Nr | Resolution ⁽³⁾ | 12 Data Bits | | | bits | |
| HAD21a | INL | Integral Nonlinearity | -5.5 | — | 5.5 | LSb | V _{INL} = AV _{SS} = V _{REFL} = 0V, AV _{DD} = V _{REFH} = 3.6V |
| HAD22a | DNL | Differential Nonlinearity | -1 | — | 1 | LSb | V _{INL} = AV _{SS} = V _{REFL} = 0V, AV _{DD} = V _{REFH} = 3.6V |
| HAD23a | GERR | Gain Error | -10 | — | 10 | LSb | V _{INL} = AV _{SS} = V _{REFL} = 0V, AV _{DD} = V _{REFH} = 3.6V |
| HAD24a | EOFF | Offset Error | -5 | — | 5 | LSb | V _{INL} = AV _{SS} = V _{REFL} = 0V, AV _{DD} = V _{REFH} = 3.6V |
| Dynamic Performance (12-Bit Mode) ⁽²⁾ | | | | | | | |
| HAD33a | FNYQ | Input Signal Bandwidth | — | — | 200 | kHz | |

Note 1: These parameters are characterized, but are tested at 20 ksp/s only.

2: These parameters are characterized by similarity, but are not tested in manufacturing.

3: Injection currents $> |0|$ can affect the ADC results by approximately 4-6 counts.

TABLE 31-16: ADC MODULE SPECIFICATIONS (10-BIT MODE)

| AC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | | |
|--|--------|---------------------------|--|-----|------|-------|--|
| Param No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |

| HAD33b | FNYQ | Input Signal Bandwidth | — | — | 400 | kHz | |

Note 1: These parameters are characterized, but are tested at 20 ksp/s only.

2: These parameters are characterized by similarity, but are not tested in manufacturing.

3: Injection currents $> |0|$ can affect the ADC results by approximately 4-6 counts.

NOTES:

32.0 DC AND AC DEVICE CHARACTERISTICS GRAPHS

Note: The graphs provided following this note are a statistical summary based on a limited number of samples and are provided for design guidance purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore, outside the warranted range.

Microchip Technology Drawing C04-2085B Sheet 1 of 1

APPENDIX A: REVISION HISTORY

Revision A (April 2011)

This is the initial released version of the document.

Revision B (July 2011)

This revision includes minor typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in [Table A-1](#).

TABLE A-1: MAJOR SECTION UPDATES

| Section Name | Update Description |
|---|---|
| “High-Performance, 16-bit Digital Signal Controllers and Microcontrollers” | Changed all pin diagrams references of VLAP to TLA. |
| Section 4.0 “Memory Organization” | Updated the All Resets values for CLKDIV and PLLFBD in the System Control Register Map (see Table 4-35). |
| Section 5.0 “Flash Program Memory” | Updated “one word” to “two words” in the first paragraph of Section 5.2 “RTSP Operation” . |
| Section 9.0 “Oscillator Configuration” | <p>Updated the PLL Block Diagram (see Figure 9-2).</p> <p>Updated the Oscillator Mode, Fast RC Oscillator (FRC) with divide-by-N and PLL (FRCPLL), by changing (FRCDIVN + PLL) to (FRCPLL).</p> <p>Changed (FRCDIVN + PLL) to (FRCPLL) for COSC[2:0] = 001 and NOSC[2:0] = 001 in the Oscillator Control Register (see Register 9-1).</p> <p>Changed the POR value from 0 to 1 for the DOZE[1:0] bits, from 1 to 0 for the FRCDIV[0] bit, and from 0 to 1 for the PLLPOST[0] bit; Updated the default definitions for the DOZE[2:0] and FRCDIV[2:0] bits and updated all bit definitions for the PLLPOST[1:0] bits in the Clock Divisor Register (see Register 9-2).</p> <p>Changed the POR value from 0 to 1 for the PLLDIV[5:4] bits and updated the default definitions for all PLLDIV[8:0] bits in the PLL Feedback Division Register (see Register 9-2).</p> |
| Section 22.0 “Charge Time Measurement Unit (CTMU)” | Updated the bit definitions for the IRNG[1:0] bits in the CTMU Current Control Register (see Register 22-3). |
| Section 25.0 “Op amp/Comparator Module” | Updated the voltage reference block diagrams (see Figure 25-1 and Figure 25-2). |

TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|--|---|
| Section 30.0 “Electrical Characteristics” | <p>Removed Voltage on VCAP with respect to Vss and added Note 5 in Absolute Maximum Ratings⁽¹⁾.</p> <p>Removed Parameter DC18 (V_{CORE}) and Note 3 from the DC Temperature and Voltage Specifications (see Table 30-4).</p> <p>Updated Note 1 in the DC Characteristics: Operating Current (I_{DD}) (see Table 30-6).</p> <p>Updated Note 1 in the DC Characteristics: Idle Current (I_{IDLE}) (see Table 30-7).</p> <p>Changed the Typical values for Parameters DC60a-DC60d and updated Note 1 in the DC Characteristics: Power-down Current (I_{PD}) (see Table 30-8).</p> <p>Updated Note 1 in the DC Characteristics: Doze Current (I_{DOZE}) (see Table 30-9).</p> <p>Updated Note 2 in the Electrical Characteristics: BOR (see Table 30-12).</p> <p>Updated Parameters CM20 and CM31, and added Parameters CM44 and CM45 in the AC/DC Characteristics: Op amp/Comparator (see Table 30-14).</p> <p>Added the Op amp/Comparator Reference Voltage Settling Time Specifications (see Table 30-15).</p> <p>Added Op amp/Comparator Voltage Reference DC Specifications (see Table 30-16).</p> <p>Updated Internal FRC Accuracy Parameter F20a (see Table 30-21).</p> <p>Updated the Typical value and Units for Parameter CTMUI1, and added Parameters CTMUI4, CTMUFV1, and CTMUFV2 to the CTMU Current Source Specifications (see Table 30-55).</p> |
| Section 31.0 “Packaging Information” | Updated packages by replacing references of VLAP with TLA. |
| “Product Identification System” | Changed VLAP to TLA. |

Revision C (December 2011)

This revision includes typographical and formatting changes throughout the data sheet text.

In addition, where applicable, new sections were added to each peripheral chapter that provide information and links to related resources, as well as helpful tips. For examples, see **Section 20.1 “UART Helpful Tips”** and **Section 3.6 “CPU Resources”**.

All occurrences of TLA were updated to VTLA throughout the document, with the exception of the pin diagrams (updated diagrams were not available at time of publication).

A new chapter, **Section 31.0 “DC and AC Device Characteristics Graphs”**, was added.

All other major changes are referenced by their respective section in [Table A-2](#).

TABLE A-2: MAJOR SECTION UPDATES

| Section Name | Update Description |
|---|--|
| “16-bit Microcontrollers and Digital Signal Controllers (up to 256-Kbyte Flash and 32-Kbyte SRAM) with High-Speed PWM, Op amps, and Advanced Analog” | The content on the first page of this section was extensively reworked to provide the reader with the key features and functionality of this device family in an “at-a-glance” format. |
| Section 1.0 “Device Overview” | Updated the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X, and PIC24EPXXXGP/MC20X Block Diagram (see Figure 1-1), which now contains a CPU block and a reference to the CPU diagram. Updated the description and Note references in the Pinout I/O Descriptions for these pins: C1IN2-, C2IN2-, C3IN2-, OA1OUT, OA2OUT, and OA3OUT (see Table 1-1). |
| Section 2.0 “Guidelines for Getting Started with 16-bit Digital Signal Controllers and Microcontrollers” | Updated the Recommended Minimum Connection diagram (see Figure 2-1). |
| Section 3.0 “CPU” | Updated the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X, and PIC24EPXXXGP/MC20X CPU Block Diagram (see Figure 3-1). Updated the Status register definition in the Programmer’s Model (see Figure 3-2). |
| Section 4.0 “Memory Organization” | Updated the Data Memory Maps (see Figure 4-6 and Figure 4-11). Removed the DCB[1:0] bits from the OC1CON2, OC2CON2, OC3CON2, and OC4CON2 registers in the Output Compare 1 Through Output Compare 4 Register Map (see Table 4-10). Added the TRIG1 and TRGCON1 registers to the PWM Generator 1 Register Map (see Table 4-13). Added the TRIG2 and TRGCON2 registers to the PWM Generator 2 Register Map (see Table 4-14). Added the TRIG3 and TRGCON3 registers to the PWM Generator 3 Register Map (see Table 4-15). Updated the second note in Section 4.7.1 “Bit-Reversed Addressing Implementation” . |
| Section 8.0 “Direct Memory Access (DMA)” | Updated the DMA Controller diagram (see Figure 8-1). |
| Section 14.0 “Input Capture” | Updated the bit values for the ICx clock source of the ICTSEL[12:10] bits in the ICxCON1 register (see Register 14-1). |
| Section 15.0 “Output Compare” | Updated the bit values for the OCx clock source of the OCTSEL[2:0] bits in the OCxCON1 register (see Register 15-1). Removed the DCB[1:0] bits from the Output Compare x Control Register 2 (see Register 15-2). |

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|--|--|
| Section 16.0 “High-Speed PWM Module (dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X Devices Only)” | Updated the High-Speed PWM Module Register Interconnection Diagram (see Figure 16-2). Added the TRGCONx and TRIGx registers (see Register 16-12 and Register 16-14, respectively). |
| Section 21.0 “Enhanced CAN (ECAN™) Module (dsPIC33EPXXXGP/MC50X Devices Only)” | Updated the CANCKS bit value definitions in CiCTRL1: ECAN Control Register 1 (see Register 21-1). |
| Section 22.0 “Charge Time Measurement Unit (CTMU)” | Updated the IRNG[1:0] bit value definitions and added Note 2 in the CTMU Current Control Register (see Register 22-3). |
| Section 25.0 “Op amp/Comparator Module” | Updated the Op amp/Comparator I/O Operating Modes Diagram (see Figure 25-1). Updated the User-programmable Blanking Function Block Diagram (see Figure 25-3). Updated the Digital Filter Interconnect Block Diagram (see Figure 25-4). Added Section 25.1 “Op amp Application Considerations” . Added Note 2 to the Comparator Control Register (see Register 25-2). Updated the bit definitions in the Comparator Mask Gating Control Register (see Register 25-5). |
| Section 27.0 “Special Features” | Updated the FICD Configuration Register, updated Note 1, and added Note 3 in the Configuration Byte Register Map (see Table 27-1). Added Section 27.2 “User ID Words” . |
| Section 30.0 “Electrical Characteristics” | Updated the following Absolute Maximum Ratings: <ul style="list-style-type: none"> Maximum current out of VSS pin Maximum current into VDD pin Added Note 1 to the Operating MIPS vs. Voltage (see Table 30-1). Updated all Idle Current (IDLE) Typical and Maximum DC Characteristics values (see Table 30-7). Updated all Doze Current (IDOZE) Typical and Maximum DC Characteristics values (see Table 30-9). Added Note 2, removed Parameter CM24, updated the Typical values Parameters CM10, CM20, CM21, CM32, CM41, CM44, and CM45, and updated the Minimum values for CM40 and CM41, and the Maximum value for CM40 in the AC/DC Characteristics: Op amp/Comparator (see Table 30-14). Updated Note 2 and the Typical value for Parameter VR310 in the Op amp/Comparator Reference Voltage Settling Time Specifications (see Table 30-15). Added Note 1, removed Parameter VRD312, and added Parameter VRD314 to the Op amp/Comparator Voltage Reference DC Specifications (see Table 30-16). Updated the Minimum, Typical, and Maximum values for Internal LPRC Accuracy (see Table 30-22). Updated the Minimum, Typical, and Maximum values for Parameter SY37 in the Reset, Watchdog Timer, Oscillator Start-up Timer, Power-up Timer Timing Requirements (see Table 30-24). The Maximum Data Rate values were updated for the SPI2 Maximum Data/Clock Rate Summary (see Table 30-35) |

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|--|--|
| Section 30.0 “Electrical Characteristics” (Continued) | <p>These SPI2 Timing Requirements were updated:</p> <ul style="list-style-type: none"> • Maximum value for Parameter SP10 and the minimum clock period value for SCKx in Note 3 (see Table 30-36, Table 30-37, and Table 30-38) • Maximum value for Parameter SP70 and the minimum clock period value for SCKx in Note 3 (see Table 30-40 and Table 30-42) • The Maximum Data Rate values were updated for the SPI2 Maximum Data/Clock Rate Summary (see Table 30-43) <p>These SPI1 Timing Requirements were updated:</p> <ul style="list-style-type: none"> • Maximum value for Parameters SP10 and the minimum clock period value for SCKx in Note 3 (see Table 30-44, Table 30-45, and Table 30-46) • Maximum value for Parameters SP70 and the minimum clock period value for SCKx in Note 3 (see Table 30-47 through Table 30-50) • Minimum value for Parameters SP40 and SP41 see Table 30-44 through Table 30-50) <p>Updated all Typical values for the CTMU Current Source Specifications (see Table 30-55).</p> <p>Updated Note1, the Maximum value for Parameter AD06, the Minimum value for AD07, and the Typical values for AD09 in the ADC Module Specifications (see Table 30-56).</p> <p>Added Note 1 to the ADC Module Specifications (12-bit Mode) (see Table 30-57).</p> <p>Added Note 1 to the ADC Module Specifications (10-bit Mode) (see Table 30-58).</p> <p>Updated the Minimum and Maximum values for Parameter AD21b in the 10-bit Mode ADC Module Specifications (see Table 30-58).</p> <p>Updated Note 2 in the ADC Conversion (12-bit Mode) Timing Requirements (see Table 30-59).</p> <p>Updated Note 1 in the ADC Conversion (10-bit Mode) Timing Requirements (see Table 30-60).</p> |

Revision D (December 2011)

This revision includes typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in [Table A-3](#).

TABLE A-3: MAJOR SECTION UPDATES

| Section Name | Update Description |
|---|---|
| “16-bit Microcontrollers and Digital Signal Controllers (up to 512-Kbyte Flash and 48-Kbyte SRAM) with High-Speed PWM, Op amps, and Advanced Analog” | Removed the Analog Comparators column and updated the Op amps/Comparators column in Table 1 and Table 2. |
| Section 21.0 “Enhanced CAN (ECAN™) Module (dsPIC33EPXXXGP/MC50X Devices Only)” | Updated the CANCKS bit value definitions in CiCTRL1: ECAN Control Register 1 (see Register 21-1). |
| Section 30.0 “Electrical Characteristics” | Updated the VBOR specifications and/or its related note in the following electrical characteristics tables: <ul style="list-style-type: none">• Table 30-1• Table 30-4• Table 30-12• Table 30-14• Table 30-15• Table 30-16• Table 30-56• Table 30-57• Table 30-58• Table 30-59• Table 30-60 |

Revision E (April 2012)

This revision includes typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in [Table A-3](#).

TABLE A-4: MAJOR SECTION UPDATES

| Section Name | Update Description |
|---|---|
| “16-bit Microcontrollers and Digital Signal Controllers (up to 512-Kbyte Flash and 48-Kbyte SRAM) with High-Speed PWM, Op amps, and Advanced Analog” | <p>The following 512-Kbyte devices were added to the General Purpose Families table (see Table 1):</p> <ul style="list-style-type: none"> • PIC24EP512GP202 • PIC24EP512GP204 • PIC24EP512GP206 • dsPIC33EP512GP502 • dsPIC33EP512GP504 • dsPIC33EP512GP506 <p>The following 512-Kbyte devices were added to the Motor Control Families table (see Table 2):</p> <ul style="list-style-type: none"> • PIC24EP512MC202 • PIC24EP512MC204 • PIC24EP512MC206 • dsPIC33EP512MC202 • dsPIC33EP512MC204 • dsPIC33EP512MC206 • dsPIC33EP512MC502 • dsPIC33EP512MC504 • dsPIC33EP512MC506 <p>Certain Pin Diagrams were updated to include the new 512-Kbyte devices.</p> |
| Section 4.0 “Memory Organization” | <p>Added a Program Memory Map for the new 512-Kbyte devices (see Figure 4-4).</p> <p>Added a Data Memory Map for the new dsPIC 512-Kbyte devices (see Figure 4-11).</p> <p>Added a Data Memory Map for the new PIC24 512-Kbyte devices (see Figure 4-16).</p> |
| Section 7.0 “Interrupt Controller” | Updated the VECNUM bits in the INTTREG register (see Register 7-7). |
| Section 11.0 “I/O Ports” | Added tip 6 to Section 11.5 “I/O Helpful Tips” . |
| Section 27.0 “Special Features” | <p>The following modifications were made to the Configuration Byte Register Map (see Table 27-1):</p> <ul style="list-style-type: none"> • Added the column Device Memory Size (Kbytes) • Removed Notes 1 through 4 • Added addresses for the new 512-Kbyte devices |
| Section 30.0 “Electrical Characteristics” | <p>Updated the Minimum value for Parameter DC10 (see Table 30-4).</p> <p>Added Power-Down Current (I_{pd}) parameters for the new 512-Kbyte devices (see Table 30-8).</p> <p>Updated the Minimum value for Parameter CM34 (see Table 30-53).</p> <p>Updated the Minimum and Maximum values and the Conditions for parameter SY12 (see Table 30-22).</p> |

Revision F (November 2012)

Removed “Preliminary” from data sheet footer.

Revision G (March 2013)

This revision includes the following global changes:

- changes “ $\overline{\text{FLT}}\text{x}$ ” pin function to “FLT x ” on all occurrences
- adds [Section 31.0 “High-Temperature Electrical Characteristics”](#) for high-temperature (+150°C) data

This revision also includes minor typographical and formatting changes throughout the text.

Other major changes are referenced by their respective section in [Table A-5](#).

TABLE A-5: MAJOR SECTION UPDATES

| Section Name | Update Description |
|--|---|
| Cover Section | <ul style="list-style-type: none"> • Changes internal oscillator specification to 1.0% • Changes I/O sink/source values to 12 mA or 6 mA • Corrects 44-pin VTLA pin diagram (pin 32 now shows as 5V tolerant) |
| Section 4.0 “Memory Organization” | <ul style="list-style-type: none"> • Deletes references to Configuration Shadow registers • Corrects the spelling of the JTAGIP and PTGWDTP bits throughout • Corrects the Reset value of all IOCON registers as C000h • Adds footnote to Table 4-42 to indicate the absence of Comparator 3 in 28-pin devices |
| Section 6.0 “Resets” | <ul style="list-style-type: none"> • Removes references to cold and warm Resets, and clarifies the initial configuration of the device clock source on all Resets |
| Section 7.0 “Interrupt Controller” | <ul style="list-style-type: none"> • Corrects the definition of GIE as “Global Interrupt Enable” (not “General”) |
| Section 9.0 “Oscillator Configuration” | <ul style="list-style-type: none"> • Clarifies the behavior of the CF bit when cleared in software • Removes POR behavior footnotes from all control registers • Corrects the tuning range of the TUN[5:0] bits in Register 9-4 to an overall range $\pm 1.5\%$ |
| Section 13.0 “Timer2/3 and Timer4/5” | <ul style="list-style-type: none"> • Clarifies the presence of the ADC Trigger in 16-bit Timer3 and Timer5, as well as the 32-bit timers |
| Section 15.0 “Output Compare” | <ul style="list-style-type: none"> • Corrects the first trigger source for SYNCSEL[4:0] (OCxCON2[4:0]) as OCxRS match |
| Section 16.0 “High-Speed PWM Module” | <ul style="list-style-type: none"> • Clarifies the source of the PWM interrupts in Figure 16-1 • Corrects the Reset states of IOCONx[15:14] in Register 16-13 as ‘11’ |
| Section 17.0 “Quadrature Encoder Interface (QEI) Module” | <ul style="list-style-type: none"> • Clarifies the operation of the IMV[1:0] bits (QEICON[9:8]) with updated text and additional notes • Corrects the first prescaler value for QFVDIV[2:0] (QE1IOC[13:11]), now 1:128 |
| Section 23.0 “10-Bit/12-Bit Analog-to-Digital Converter (ADC)” | <ul style="list-style-type: none"> • Adds note to Figure 23-1 that Op Amp 3 is not available in 28-pin devices • Changes “sample clock” to “sample trigger” in AD1CON1 (Register 23-1) • Clarifies footnotes on op amp usage in Registers 23-5 and 23-6 |
| Section 25.0 “Op Amp/Comparator Module” | <ul style="list-style-type: none"> • Adds Note text to indicate that Comparator 3 is unavailable in 28-pin devices • Splits Figure 25-1 into two figures for clearer presentation (Figure 25-1 for Op amp/Comparators 1 through 3, Figure 25-2 for Comparator 4). Subsequent figures are renumbered accordingly. • Corrects reference description in xxxxx (now (AVDD+AVSS)/2) • Changes CMSTAT[15] in Register 25-1 to “PSIDL” |
| Section 27.0 “Special Features” | <ul style="list-style-type: none"> • Corrects the addresses of all Configuration bytes for 512 Kbyte devices |

TABLE A-5: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|---|---|
| Section 30.0 “Electrical Characteristics” | <ul style="list-style-type: none"> • Throughout: qualifies all footnotes relating to the operation of analog modules below VDDMIN (replaces “will have” with “may have”) • Throughout: changes all references of SPI timing parameter symbol “TscP” to “FscP” • Table 30-1: changes VDD range to 3.0V to 3.6V • Table 30-4: removes Parameter DC12 (RAM Retention Voltage) • Table 30-7: updates Maximum values at 10 and 20 MIPS • Table 30-8: adds Maximum IPD values, and removes all ΔI_{WDT} entries • Adds new Table 30-9 (Watchdog Timer Delta Current) with consolidated values removed from Table 30-8. All subsequent tables are renumbered accordingly. • Table 30-10: adds footnote for all parameters for 1:2 Doze ratio • Table 30-11: <ul style="list-style-type: none"> - changes Minimum and Maximum values for D120 and D130 - adds Minimum and Maximum values for D131 - adds Minimum and Maximum values for D150 through D156, and removes Typical values • Table 30-12: <ul style="list-style-type: none"> - reformats table for readability - changes IOL conditions for DO10 • Table 30-14: adds footnote to D135 • Table 30-17: changes Minimum and Maximum values for OS30 • Table 30-19: <ul style="list-style-type: none"> - splits temperature range and adds new values for F20a - reduces temperature range for F20b to extended temperatures only • Table 30-20: <ul style="list-style-type: none"> - splits temperature range and adds new values for F21a - reduces temperature range for F20b to extended temperatures only • Table 30-53: <ul style="list-style-type: none"> - adds Maximum value to CM30 - adds footnote (“Parameter characterized...”) to multiple parameters • Table 30-55: adds Minimum and Maximum values for all CTMUI specifications, and removes Typical values • Table 30-57: adds new footnote to AD09 • Table 30-58: <ul style="list-style-type: none"> - removes all specifications for accuracy with external voltage references - removes Typical values for AD23a and AD24a - replaces Minimum and Maximum values for AD21a, AD22a, AD23a and AD24a with new values, split by Industrial and Extended temperatures - removes Maximum value of AD30 - removes Minimum values from AD31a and AD32a - adds or changes Typical values for AD30, AD31a, AD32a and AD33a • Table 30-59: <ul style="list-style-type: none"> - removes all specifications for accuracy with external voltage references - removes Maximum value of AD30 - removes Typical values for AD23b and AD24b - replaces Minimum and Maximum values for AD21b, AD22b, AD23b and AD24b with new values, split by Industrial and Extended temperatures - removes Minimum and Maximum values from AD31b, AD32b, AD33b and AD34b - adds or changes Typical values for AD30, AD31a, AD32a and AD33a • Table 30-61: Adds footnote to AD51 |
| Section 32.0 “DC and AC Device Characteristics Graphs” | <ul style="list-style-type: none"> • Updates Figure 32-6 (Typical IDD @ 3.3V) with individual current vs. processor speed curves for the different program memory sizes |
| Section 33.0 “Packaging Information” | <ul style="list-style-type: none"> • Replaces drawing C04-149C (64-pin QFN, 7.15 x 7.15 exposed pad) with C04-154A (64-pin QFN, 5.4 x 5.4 exposed pad) |

Revision H (August 2013)

This revision includes minor typographical and formatting changes throughout the text.

Other major changes are referenced by their respective section in [Table A-6](#).

TABLE A-6: MAJOR SECTION UPDATES

| Section Name | Update Description |
|---|--|
| Cover Section | <ul style="list-style-type: none"> Adds Peripheral Pin Select (PPS) to allow Digital Function Remapping and Change Notification Interrupts to Input/Output section Adds heading information to 64-Pin TQFP |
| Section 4.0 “Memory Organization” | <ul style="list-style-type: none"> Corrects Reset values for ANSELE, TRISF, TRISC, ANSELG and TRISA Corrects address range from 0x2FFF to 0x7FFF Corrects DSRPAG and DSWPAG (now 3 hex digits) Changes Call Stack Frame from [15:1] to PC[15:0] Word length in Figure 4-20 is changed to 50 words for clarity |
| Section 5.0 “Flash Program Memory” | <ul style="list-style-type: none"> Corrects descriptions of NVM registers |
| Section 9.0 “Oscillator Configuration” | <ul style="list-style-type: none"> Removes resistor from Figure 9-1 Adds Fast RC Oscillator with Divide-by-16 (FRCDIV16) row to Table 9-1 Removes incorrect information from ROI bit in Register 9-2 |
| Section 14.0 “Input Capture” | <ul style="list-style-type: none"> Changes 31 user-selectable Trigger/Sync interrupts to 19 user-selectable Trigger/Sync interrupts Corrects ICTSEL[12:10] bits (now ICTSEL[2:0]) |
| Section 17.0 “Quadrature Encoder Interface (QE) Module (dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X Devices Only)” | <ul style="list-style-type: none"> Corrects QCAPEN bit description |
| Section 19.0 “Inter-Integrated Circuit (I²C)” | <ul style="list-style-type: none"> Adds note to clarify that 100kbit/sec operation of I²C is not possible at high processor speeds |
| Section 22.0 “Charge Time Measurement Unit (CTMU)” | <ul style="list-style-type: none"> Clarifies Figure 22-1 to accurately reflect peripheral behavior |
| Section 23.0 “10-Bit/12-Bit Analog-to-Digital Converter (ADC)” | <ul style="list-style-type: none"> Correct Figure 23-1 (changes CH123x to CH123Sx) |
| Section 24.0 “Peripheral Trigger Generator (PTG) Module” | <ul style="list-style-type: none"> Adds footnote to Register 24-1 (In order to operate with CVRSS=1, at least one of the comparator modules must be enabled). |
| Section 25.0 “Op Amp/Comparator Module” | <ul style="list-style-type: none"> Adds note to Figure 25-3 (In order to operate with CVRSS=1, at least one of the comparator modules must be enabled) Adds footnote to Register 25-2 (COE is not available when OPMODE (CMxCON[10]) = 1) |
| Section 27.0 “Special Features” | <ul style="list-style-type: none"> Corrects the bit description for FNOSC[2:0] |
| Section 30.0 “Electrical Characteristics” | <ul style="list-style-type: none"> Corrects 512K part power-down currents based on test data Corrects WDT timing limits based on LPRC oscillator tolerance |
| Section 31.0 “High-Temperature Electrical Characteristics” | <ul style="list-style-type: none"> Adds Table 31-5 (DC Characteristics: Idle Current (I_{IDLE})) |

Revision J (June 2020)

This revision includes minor typographical and formatting changes throughout the text.

Other major changes are referenced by their respective section in [Table A-7](#).

TABLE A-7: MAJOR SECTION UPDATES

| Section Name | Update Description |
|--|---|
| Cover Section | <ul style="list-style-type: none"> Removes “Planned” from the “Qualification and Class B Support” section. Adds UQFN package to Table 1 and Table 2. Adds two 36-pin UQFN pin diagrams. Changes the RD8 pin to non-5V tolerant. Adds the “Referenced Sources” section. |
| Section 2.7 “Oscillator Value Conditions on Device Start-up” | <ul style="list-style-type: none"> Corrects the oscillator source frequency. |
| Section 3.0 “CPU” | <ul style="list-style-type: none"> Changes to Note 1 here and every chapter throughout document. |
| Section 4.0 “Memory Organization” | <ul style="list-style-type: none"> Changes to Figure 4-11 and Figure 4-16. Changes to Table 4-35. |
| Section 5.0 “Flash Program Memory” | <ul style="list-style-type: none"> Changes to Register 5-1. |
| Section 7.0 “Interrupt Controller” | <ul style="list-style-type: none"> Changes to Table 7-1. |
| Section 9.0 “Oscillator Configuration” | <ul style="list-style-type: none"> Changes to Table 9-1. |
| Section 10.0 “Power-Saving Features” | <ul style="list-style-type: none"> Replaces Example 10-1 and adds Example 10-2. Changes to Section 10.2.1 “Sleep Mode”. |
| Section 11.0 “I/O Ports” | <ul style="list-style-type: none"> Changes to Section 11.2 “Configuring Analog and Digital Port Pins”. |
| Section 13.0 “Timer2/3 and Timer4/5” | <ul style="list-style-type: none"> Changes to Register 13-1 and Register 13-2. |
| Section 14.0 “Input Capture” | <ul style="list-style-type: none"> Changes to Register 14-2. |
| Section 16.0 “High-Speed PWM Module (dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X Devices Only)” | <ul style="list-style-type: none"> Changes to Note in Section 16.0 “High-Speed PWM Module (dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X Devices Only)”. Changes to Register 16-7 and Register 16-13. |
| Section 23.0 “10-Bit/12-Bit Analog-to-Digital Converter (ADC)” | <ul style="list-style-type: none"> Changes to Register 23-8. |
| Section 25.0 “Op Amp/Comparator Module” | <ul style="list-style-type: none"> Changes to Figure 25-1. Changes to Section 25.1 “Op Amp Application Considerations”. Changes to Register 25-2 and Register 25-7. |
| Section 27.0 “Special Features” | <ul style="list-style-type: none"> Changes to Table 27-2. |
| Section 30.0 “Electrical Characteristics” | <ul style="list-style-type: none"> Changes to Table 30-3, Table 30-6, Table 30-11, Table 30-14 and Table 30-53. |
| Section 31.0 “High-Temperature Electrical Characteristics” | <ul style="list-style-type: none"> Changes to Table 31-2. Adds Table 31-9, Table 31-10 and Table 31-13. |
| Section 32.0 “DC and AC Device Characteristics Graphs” | <ul style="list-style-type: none"> Replaces Figure 32-10. |
| Section 33.0 “Packaging Information” | <ul style="list-style-type: none"> Adds package marking diagram in Section 33.1 “Package Marking Information”. Adds packaging diagrams to Section 33.2 “Package Details”. |
| “Product Identification System” | <ul style="list-style-type: none"> Adds M5 packaging description. |

NOTES:

THE MICROCHIP WEBSITE

Microchip provides online support via our WWW site at www.microchip.com. This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip website at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the website at: <http://microchip.com/support>

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

Industrial Temperature,
TQFP package.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
