LOW VOLTAGE AUDIO AMPLIFIER

INTRODUCTION

The KA8602B is the audio power amplifier available for low voltages. KA8602B supplies differential outputs for maximizing output swing at low voltages. KA8602B doesn't need coupling capacitors to the speaker. The gain of this amp is controlled easily by two external resistors.

PIN CONFIGURATION

Fig. 2

PIN DESCRIPTION

Pin No	Symbol	Description
1	Input (+)	Analog Ground for the amplifiers. A 1.0μF capacitor at this pin (with a 5.0μF capacitor at pin 8) provides 52dB (Typ) of power supply rejection. Turn-on time of the circuit is affected by the capacitor on this pin. This pin can be used as an alternative input.
2	Input (-)	Amplifier input. The input capacitor and resistor set low frequency roll-off and input impedance. The feedback resistor is connected between this pin and output1.
3	Output 1	Amplifier 1's output. The DC Level is $\frac{V_{CC} - 0.7V}{2}$.
4	V _{CC}	DC supply voltage (+2.0 ~ + 16V) is applied to this pin.
5	GND	Ground pin.
6	Output 2	Amplifier 2's output. This signal is equal in amplitude, but 180° out of phase with that at output1. The DC level is $\frac{V_{CC} - 0.7V}{2}$.
7	Mute	This pin can be used to power down the IC to conserve power, or for muting, or both. When at a logic "Low" (0 to 0.8 volts), the KA8602B is enabled for normal operation. When at a logic "High" (2.0 to V _{CC} volts), the IC is disabled. If Mute is open, that is equivalent to a logic "Low".
8	Ripple Rejection	A capacitor at this pin increases power supply rejection, and affects turn-on time. This pin can be left open if the capacitor at pin 1 is sufficient.
